Fayette County's Hazard Mitigation Plan Update 2020

This document was funded in part by the Hazard Mitigation Planning Grant awarded to the Fayette County Emergency Management Agency by the Georgia Emergency Management Agency (GEMA) to fulfill the requirements of the Federal Disaster Mitigation Act of 2000 (DMA 2000). Fayette County's Hazard Mitigation Plan 2015 was updated by the Fayette County Hazard Mitigation Plan Update Committee and was prepared by Lux Mitigation and Planning Corp. For additional information, please contact Fayette County Emergency Management Agency.

Resolution – Fayette County**RESOLUTION 2020-11 – FAYETTE COUNTY, GEORGIA****FAYETTE COUNTY HAZARD MITIGATION PLAN 2020-2025**

WHEREAS, Fayette County and its municipalities recognize that it is threatened by several different types of natural and man-made hazards that can result in loss of life, property loss, economic hardship and threats to public health and safety; and

WHEREAS, the Federal Emergency Management Agency (FEMA) has required that every county and municipality have a pre-disaster mitigation plan in place, and requires the adoption of such plans in order to receive funding from the Hazard Mitigation Grant Program; and

WHEREAS, a Hazard Mitigation Plan is a community's plan for evaluating hazards, identifying resources and capabilities, selecting appropriate actions, and developing and implementing the preferred mitigation actions to eliminate or reduce future damage in order to protect the health, safety and welfare of the residents in the community; and

WHEREAS, the Fayette County Hazard Mitigation Plan 2020 – 2025 has been prepared in accordance with FEMA requirements at 44 CFR 201.6; and

WHEREAS, the Plan will be updated every five years;

NOW, THEREFORE, BE IT RESOLVED, by the Board of Commissioners of Fayette County, Georgia, that:

- 1) Fayette County, Georgia, hereby adopts the Fayette County Hazard Mitigation Plan 2020 - 2025 attached hereto as Exhibit "A" with said Exhibit "A" incorporated in this resolution in its entirety by this reference; and
- 2) It is intended that the Plan be a working document and is the first of many steps toward improving rational, long-range mitigation planning and budgeting for Fayette County and its municipalities.

PASSED, APPROVED AND ADOPTED by the Fayette County Board of Commissioners in regular session this 12th day of November, 2020.

Chairperson

County Clerk

Resolution – Fayette County Municipalities

Requirement §201.6(c)(5)

**THE TOWN OF BROOKS
FAYETTE COUNTY, GEORGIA**

RESOLUTION NO. 2021-01**A RESOLUTION ACCEPTING THE FAYETTE COUNTY MULTI-JURISDICTIONAL HAZARD MITIGATION PLAN**

WHEREAS: The Town of Brooks is one of the five municipalities in Fayette County, and;

WHEREAS: In in spirit of cooperative association with other local governments in Fayette County, the Town of Brooks endorses and subscribes to mutual aid and association, and;

WHEREAS: The Fayette County Multi-Jurisdictional Hazard Mitigation Plan has been completed in accordance with the Federal Hazard Mitigation Planning Standards contained in 44 CFR 201.6(b)-(d), and;

WHEREAS: The Federal Emergency Management Agency (FEMA) has completed its review of the Fayette County Multi-Jurisdictional Hazard Mitigation Plan; now

NOW, THEREFORE, WE, The Mayor and Town Council of the Town of Brooks do hereby resolve to accept The Fayette County Multi-Jurisdictional Hazard Mitigation Plan.

So Proclaimed this 25th Day of January 2021.

Preface

Mitigation Vision for the Future

Emergency Managers succeed or fail based on how well they follow the following fundamental principles of emergency management, mitigation, preparedness, response, and recovery. Purposefully, our emergency management forefathers put the word mitigation first as a “means” to prevent or minimize the effects of disasters.

Mitigation is commonly defined as sustained actions taken to reduce or eliminate long-term risk to people and property from hazards and their effects. Hazard mitigation focuses attention and resources on community policies and actions that will produce successive benefits over time. A mitigation plan states the aspirations and specific courses of action that a community intends to follow to reduce vulnerability and exposure to future hazard events. These plans are formulated through a systematic process centered on the participation of citizens, businesses, public officials, and other community stakeholders.

Mitigation forms, or should form, the very foundation of every emergency management agency. To reduce, minimize, or eliminate hazards in their communities, emergency management agencies adopt and implement mitigation practices. The Federal DMA 2000 sets the benchmark and outlines the criteria for communities with the vision to implement hazard mitigation practices in their communities.

Fayette County and its municipalities realize the benefits achieved by the development and implementation of mitigation plans and strategies in their community. Fayette County’s elected officials, public safety organizations, planners, and many others have proven that by working together towards the development and implementation of this plan, they can reduce the loss of life and property in their communities.

The jurisdictions covered by this plan include the following:

Fayette County
City of Fayetteville
City of Peachtree City
Town of Brooks
Town of Tyrone
Town of Woolsey

Introduction

The Fayette County Hazard Mitigation Plan Update is the first phase of a multi-hazard mitigation strategy for the entire community. This Plan encourages cooperation among various organizations and crosses political sub-divisions. As written, this Plan fulfills the requirements of the Federal DMA 2000. DMA 2000 provides federal assistance to state and local emergency management agencies and other disaster response organizations to reduce damage from disasters. The Act is administered by GEMA and FEMA.

It is important that state and local government, public-private partnerships, and community citizens can see the results of these mitigation efforts; therefore, the goals and strategies need to be achievable. Fayette County's Hazard Mitigation Plan Update Committee adopted the following goals during plan development:

- GOAL 1 Protect the public health and safety
- GOAL 2 Reduce and eliminate (to the extent possible) community exposure to natural and technological hazard events
- GOAL 3 Reduce loss and damage to private property and public infrastructure resulting from natural or technological hazards
- GOAL 4 Maintain continuity of public and private sector operations during and after hazard events
- GOAL 5 Respond promptly, appropriately, and efficiently in the event of natural or technological hazards

This plan complies with all requirements and scope of work as described in Fayette County's Hazard Mitigation Grant application.

Authority

In the past, federal legislation has provided funding for disaster relief, recovery, and some hazard mitigation planning. The DMA 2000 is the latest legislation to improve the planning aspect of that process; it reinforces the importance of mitigation planning and emphasizes planning for disasters before they occur. The DMA 2000 establishes a pre-disaster hazard mitigation program and designates new requirements for the national post-disaster Hazard Mitigation Grant Program (HMGP). Section 322 identifies the new requirements for planning activities and increases the amount of HMGP funds available to states that have developed a comprehensive mitigation plan prior to the disaster.

State and local communities must have an approved mitigation plan in place prior to receiving post-disaster HMGP funds. Local mitigation plans must demonstrate that their proposed mitigation measures are based on a sound planning process that accounts for the risk to and the capabilities of the individual communities. To implement the new DMA 2000 requirements, FEMA prepared an Interim Final Rule, published in the Federal Register on February 26, 2002 at 44 CFR Parts 201 and 206, which establishes planning and funding criteria for states and local communities.

Developed in accordance with current state and federal rules and regulations governing local hazard mitigation plans, Fayette County's Updated Hazard Mitigation Plan will be brought forth to each participating jurisdiction in Fayette County to be formally adopted. The Plan shall be routinely monitored and revised to maintain compliance with the following provisions, rules, and legislation:

Section 322, Mitigation Planning, of the Robert T. Stafford Disaster Relief and Emergency Assistance Act, as enacted by Section 104 of the Disaster Mitigation Act of 2000 (P.L. 106-390); and

FEMA's Interim Final Rule published in the Federal Register on February 26, 2002, at 44 CFR Part 201.

Funding

Fayette County was awarded a \$24,000 Hazard Mitigation Planning Grant by FEMA through GEMA for the update of Fayette County's 2015 Hazard Mitigation Plan. FEMA contributed 75% and GEMA contributed 10% of the total cost of the Plan Update. The Hazard Mitigation Planning Grant required a 15% match by Fayette County. This match was fulfilled entirely (100%) by In-Kind contributions – time spent by county and municipal employees, local stakeholders, representatives from organizations, and citizen volunteers updating the Plan was provided instead of cash from the County's budget.

Scope

The scope of the Fayette County Hazard Mitigation Plan Update encompasses all areas of Fayette County, including municipalities. The Plan identifies all natural and technological hazards that could threaten life and property in Fayette County. The scope of this Plan includes both short and long-term mitigation strategies with implementation and possible sources of project funding.

The Hazard Mitigation Plan Update is organized to incorporate the requirements of Interim Final Rule 44 CFR 201.4.

Chapter One includes an overview of the Hazard Mitigation Plan Update, the overall goals of the plan, and details of the planning process as required by Interim Final Rule 44 CFR 201.4(c)(1).

Chapter Two of the Plan details the Fayette County profile, including the demographics, municipalities, and history of the county.

Chapter Three identifies the risk assessment process, past natural hazard events with associated losses, and current natural hazard risks. Potential losses are also analyzed as required by Interim Final Rule 44 CFR 201.4(c)(2). Additionally, Chapter Three identifies and analyzes potential technological hazards faced by Fayette County.

Chapter Four identifies Fayette County's hazard mitigation goals and objectives, mitigation strategies and actions, and sources of potential funding for mitigation projects as required by Interim Final Rule 44 CFR 201.4(c)(3).

Chapter Five identifies the maintenance and implementation strategies for the Plan. The process for evaluation of the Hazard Mitigation Plan implementation progress is also detailed as required by Interim Final Rule 44 CFR 201.4(c)(4) and (5).

Purpose

The purpose of the Fayette County Hazard Mitigation Plan Update is to:

- Protect life, promote safety, and preserve property by reducing the potential for future damages and economic losses that result from natural and technological hazards;
- Make communities in Fayette County safer places to live, work, and play;
- Qualify for grant funding in both the pre-disaster and post-disaster environments;
- Speed the recovery and redevelopment process following future disaster events;
- Demonstrate a firm local commitment to hazard mitigation principles; and
- Comply with state and federal legislative requirements for local multi-jurisdictional hazard mitigation plans.

Consistency with Federal and State Mitigation Policies

The Plan is intended to enhance and complement state and federal recommendations for the mitigation of natural and technological hazards in the following ways:

- Substantially reduce the risk of life, injuries, and hardship from the destruction of natural and technological disasters on an ongoing basis;
- Create greater public awareness about the need for individual preparedness and about the need to build safer, more disaster resistant communities;
- Develop strategies for long-term community sustainability during community disasters; and,
- Develop governmental and business continuity plans that will continue essential private sector and governmental activities during disasters.

FEMA publishes several guidance documents for local governments on mitigating natural disasters. The updated Fayette County Hazard Mitigation Plan recognizes, adopts, incorporates, and endorses the following principles:

- Develop a strategic mitigation plan for Fayette County;
- Enforce current building codes;
- Develop incentives to promote mitigation;
- Incorporate mitigation of natural hazards into land use plans;
- Promote awareness of mitigation opportunities and programs throughout our community on a continual basis; and,
- Identify potential funding sources for mitigation projects.

The private sector is often an overlooked segment of the community during disasters. It is vital that this sector of a community is included in mitigation efforts that are consistent with state and federal recommendations, such as the following:

- Develop mitigation incentives with insurance agencies and lending institutions;

- Encourage the creation of a business continuity plan for the continuance of commerce during and following a disaster; and,
- Partner with local businesses to educate customers about potential hazards in the community and possible mitigation ideas.

Individual citizens must be made aware of the hazards they may encounter. Additionally, they must be educated on how to protect themselves from the hazards they face. They must be shown that mitigation is an important part of reducing loss of life and property in their community. Their support is critical to the success of any mitigation effort. The updated Fayette County Hazard Mitigation Plan supports the following FEMA recommendations regarding individual citizens:

- Become educated on the hazards that may impact your community;
- Become part of the process by supporting and encouraging mitigation programs that reduce vulnerability to disasters; and,
- An individual's responsibility is to safeguard his/her family, as well as themselves, prior to a disaster event.

Plan Review

Requirement §201.6(c)(1)

The contractor, Lux Mitigation and Planning, had the primary responsibility for collecting updated information and presenting pertinent data to the Plan Update Committee. An online, Dropbox folder was created for Fayette County's Plan Update. The approved 2015 Hazard Mitigation Plan was uploaded to the Dropbox folder, and the link to the folder was emailed to all members of the Hazard Mitigation Plan Update Committee. Each chapter of the 2015 Plan was reviewed. Hazard vulnerability and risk assessment data was updated, as was critical infrastructure information.

Special attention and consideration were given to the review and edit of mitigation strategies listed in the 2015 Plan. The Plan Update Committee examined each strategy and determined whether the strategy had been completed, needed to be modified, was in progress, or no longer applied. The Committee was highly encouraged to create new mitigation strategies to meet the current needs of the county and municipalities. Mitigation strategies from other Georgia counties were reviewed to help with the creation of new strategies. When the Committee agreed a new mitigation action would be beneficial, it was tailored to Fayette County's needs and was included in the 2020 Plan. The contractor sent the Committee, including sporadically attending participants, regular emails which contained a Dropbox link to the most updated version of the Plan and encouraged the Committee to thoroughly critique each version.

Fayette County's Hazard Mitigation Plan Update Meeting Dates:

| | |
|------------------------------|--|
| Thursday, August 22, 2019 | Kick-Off Meeting |
| Thursday, September 26, 2019 | Hazard Identification and Prioritization; Update Critical Facilities Information (Public Meeting #1) |
| Thursday, October 24, 2019 | Analysis of Hazard Profile Research; Review and Edit 2015 Hazard Mitigation Strategies |

Thursday, February 20, 2020

Review and Edit 2020 Hazard Mitigation Plan -
Final Draft; Update Plan Distribution List;
Discuss Available Hazard Mitigation Grants

Each section of Fayette County's 2015 Hazard Mitigation Plan has been revised in some manner. Therefore, a summary of those changes will be listed in the first section of each chapter. Significant additions/modifications to this Plan include the following:

- Wildfire added to Natural Hazards
- Earthquakes added to Natural Hazards
- Tropical Cyclones added to Natural Hazards
- Extreme Temperatures added to Natural Hazards
- Transportation Incident added to Technological Hazards
- Terrorism added to Technological Hazards
- Infrastructure Failure added to Technological Hazards
- Emergent Infectious Diseases added to Technological Hazards

The Plan Update Committee relied on their consultant to guide them through the update process. During meetings, the participants had productive discussions, expanded their professional networks, asked thoughtful questions, made important decisions, and provided critical input during key stages in the update process. Efforts were made to involve all county and municipal departments, as well as community organizations and local businesses, which may have a role in the implementation of mitigation actions and/or policies. These efforts included sending invitations via email to attend the Kick-off Meeting, sending reminder emails before each upcoming meeting, emailing pertinent information throughout the process, and requesting the review and critique of each chapter in the updated Plan.

All neighboring counties – Clayton, Coweta, Fulton, and Spalding – were asked to peer review the 2020 Mitigation Plan draft. The Plan was sent to each County EMA office. Additionally, the EMA Directors from surrounding counties were asked to attend Plan Update Committee meetings in hopes they would share mitigation ideas from their own counties. Spalding County EMA Director Glen Polk attended meetings on behalf of his jurisdiction and provided input and feedback on the Fayette County Hazard Mitigation Plan and planning process.

Public Participation

Requirement §201.6(b)(1)

State Requirement Element F2

Public awareness is a key component of any community's overall mitigation strategy. As citizens become more involved in decisions that affect their safety, they may develop a greater respect for the natural hazards present in their community, and thus, may take the steps necessary to reduce potential impacts of those hazards.

The following local organizations and businesses participated in the update of Fayette County's 2015 Mitigation Plan: Castle Lake Estates Homeowner's Association, Castle Lake Funding Group, Georgia Power, Piedmont Fayette Hospital, Pinewood Forest Homeowner's Association, and Real Life Center.

The Plan Update Committee took it upon themselves to ensure the processes undertaken for the development, implementation, and maintenance of the 2020 Hazard Mitigation Plan adequately considered public needs and viewpoints.

A list of public outreach initiatives can be found below:

- Email reminders were sent to all Plan Update Committee members, as well as other stakeholders, prior to every meeting. Recipients were encouraged to share the meeting invitation with anyone they thought would be an asset to the Plan Update process or anyone who may want to learn more about what a Hazard Mitigation Plan is.
- The Emergency Management Director for all neighboring jurisdictions – Fulton, Coweta, Spalding, and Clayton Counties – were included on all meeting invitations and reminder emails for the Fayette County Hazard Mitigation Plan Update. Spalding County EMA Director Glenn Polk did attend meetings to provide input and feedback on behalf of Spalding County.
- A Public Meeting was held on January 23, 2020 in conjunction with the regularly scheduled meeting of the Fayette County Hazard Mitigation Planning Committee. This meeting was advertised through multiple means, including on the front page of the Fayette County Government website, the Facebook pages for the Fayetteville Police Department, Tyrone Police Department, Fayette County 911, Fayette County Department of Fire and Emergency Services, and in the January 22, 2020 edition of the Fayette Daily News.

- Five private citizens participated in the Fayette County Hazard Mitigation Planning process as representatives of the Pinewood Forest and Castle Lake Estates Homeowner's Associations. These individuals actively participated in the meetings they attended. Their feedback and insight were incorporated as part of the overall planning process. These individuals were pursuing a potential mitigation project for dam remediation. This mitigation project is included in the mitigation strategies listed in Chapter 4.

Documentation of Public Meeting Notice

Fayette County Government Website – Public Meeting #2

Public Meeting

All citizens are invited to attend and are encouraged to participate in Fayette County's Hazard Mitigation Plan Update project. A meeting will be held on Thursday, January 23rd, at 10:00 am to discuss potentially impactful natural hazards and create mitigation actions that can be accomplished beforehand to lessen the impact of those hazards, if they were to occur.

The meeting will be held in the classroom of Fayette County's Emergency Operations Center - located at 110 Volunteer Way in Fayetteville.

For more information, please contact Captain Mike Singleton, Director of Fayette County Emergency Management, at msingleton@fayettecountyga.gov.

Public meeting for the Fayette County Hazard Mitigation Plan Update project. Please see below:

Multi-Jurisdictional Considerations

FEMA does not require cities and towns to adopt a local Hazard Mitigation Plan. However, the Federal DMA 2000 requires that all municipalities, wishing to be eligible to receive Hazard Mitigation Grants through FEMA, must adopt a local multi-hazard mitigation plan and must update that plan every five years. Fayette County's most recent Hazard Mitigation Plan was approved by FEMA in 2015. The 2020 Mitigation Plan is the third five-year update. This FEMA-approved 2020 Hazard Mitigation Plan makes Fayette County, City of Fayetteville, City of Peachtree City, Town of Brooks, Town of Tyrone and Town of Woolsey eligible for FEMA's Hazard Mitigation Grant Program, Flood Assistance Mitigation Grants, and Pre-Disaster Mitigation Grants.

As set forth by Georgia House Bill 489, the Emergency Management Agency is the implementing agency for projects pertaining to hazard mitigation. Fayette County is dedicated to work in the best interests of the County, as well as, its municipalities. A few mitigation strategies in Fayette County's 2020 Mitigation Plan apply to a specific municipality. Unless noted otherwise, mitigation strategies apply equally to all jurisdictions. During the creation and update of this Plan, Fayette County Emergency Management Agency solicited and received participation from the following Fayette County municipalities: City of Fayetteville, City of Peachtree City, Town of Brooks, Town of Tyrone, and Town of Woolsey.

Past Hazards

Fayette County, Georgia, has faced many natural hazards in its long history. Severe thunderstorms have been the most prevalent of these hazards. In the last 50 years, Fayette County has been subjected to 211 documented severe thunderstorm events. These events include torrential rainfall, hail, thunderstorm-force winds, and lightning.

Tornadoes, which can sometimes spawn from severe thunderstorms, have also occurred, although with much less frequency. In Fayette County, there have been 7 documented tornadoes in the last 50 years.

Because of heavy rainfall, either within Fayette County or upstream, flooding has also occurred. In the National Climatic Data Center (NCDC) databases of the National Weather Service, there is documentation of 19 flooding events for Fayette County.

Winter storms and heavy snowfall have affected Fayette County over the last 50 years. Because these natural events are barely an annual occurrence, the pre-planning and preparedness component of emergency management is not as robust as northern or western states that routinely see this type of weather. The NCDC recorded 24 winter storms or heavy snow events for Fayette County with two of those events occurring in the last five years.

Fayette County has been impacted by other less severe or less frequent hazards in the past. These hazards include, but are not limited to, the following: drought, excessive heat, tropical cyclones, earthquakes, and wildfires.

Fayette County has had ten Presidential Disaster Declarations (FEMA-declared major disasters) – two of which have occurred since the adoption of the 2015 Hazard Mitigation Plan (Severe Storms and Flooding in 2016 and Hurricane Irma in 2017).

History

Fayette County was enacted as a result of the Land Lottery Draw of 1821. The land was ceded from the Creek Indian Nation and five new counties were created: Fayette, Henry, Houston, Dooly, Monroe, and Fayette is therefore an original county (not created from other counties) and the 49th county in Georgia.

At this time, the county went up to present-day Atlanta and over to the other side of Jonesboro. Four counties have been carved in part from us, Campbell (now Fulton, DeKalb, Clayton, and Spalding).

Because some of the new settlers were Revolutionary War veterans, it is surmised that they were the ones instrumental in naming the county for Marquis de LaFayette, who fought alongside General George Washington in that war.

Fayetteville was named as the county seat in 1823 and the present-day courthouse in the town square was built in 1825. It remains the oldest courthouse in Georgia and is still in municipal use.

It remained the only city until the 1900s, although there were a few small communities that had names.

Incorporated cities at the present time are the following: Fayetteville, Peachtree City, Tyrone, Brooks, and Woolsey.

During The War Between The States, cavalry activity took place in the middle of the county. A several hundred Confederate wagon supply train was burned just two miles west of Fayetteville and one of the last cavalry skirmishes took place the next day. This activity was an indirect part of The Battle of Atlanta.

In the 1930s, Margaret Mitchell spent time in Fayette County researching facts for her *GONE WITH THE WIND*. Her great Grandfather, Phillip Fitzgerald, came to Fayette County in the 1830s and the Fitzgeralds were the prototypes for the O'Hara in the book. They are buried in the Fayetteville City Cemetery.

The Holliday family was from Fayette County and one of "Doc" Holliday's cousins married a Fitzgerald, making the famed old west character a "kissin' cousin" of Margaret Mitchell.

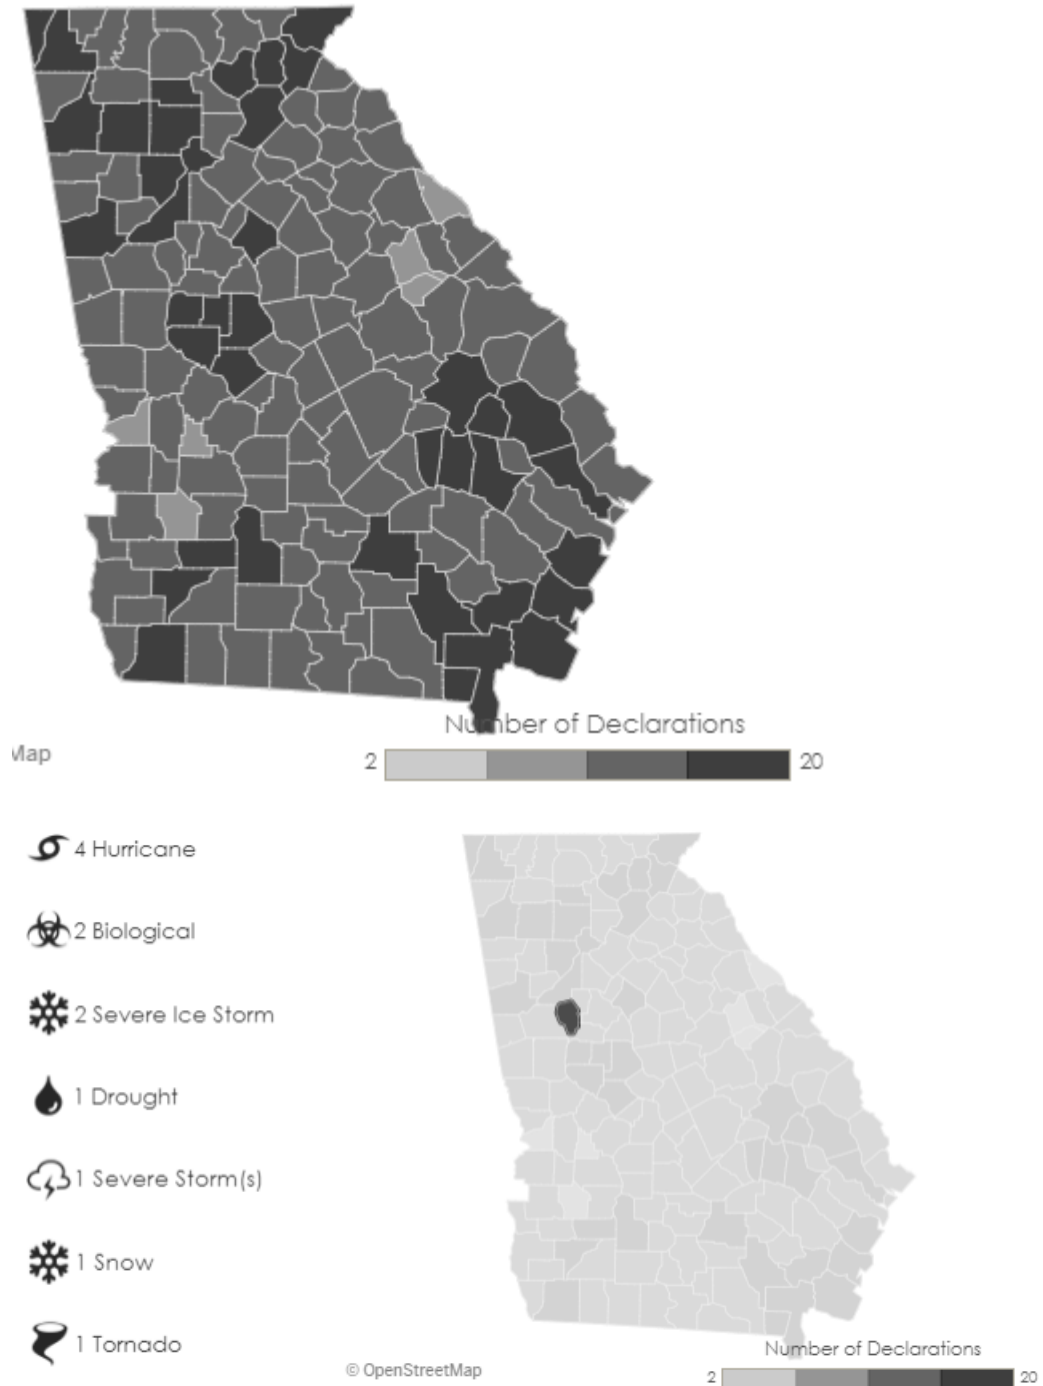

Peachtree City was enacted in 1959 and is the only successful pre-planned city in the southeast. Be sure to note the water fountain in its City Plaza, a donation of all the Japanese companies who have opened companies in Peachtree City.

| Median Age | 38.2 | 42.4 | 43.5 |
| Median Household Income | \$71,227 | ----- | \$84,861 |
| Persons in Poverty | 2.6% | ----- | 6.3% |
| Homeowners | 86.4% | 82.9% | 81.0% |

Municipalities

| | 2000 Census | 2010 Census | 2017 Census Estimates |
|----------------|-------------|-------------|-----------------------|
| Brooks | 553 | 524 | 484 |
| Fayetteville | 11,148 | 15,945 | 17,069 |
| Peachtree City | 31,580 | 34,364 | 34,988 |
| Tyrone | 3,916 | 6,879 | 7,199 |
| Woolsey | 175 | 158 | 186 |

Economy

Fayette County's economy is primarily agricultural with some light industry. Fayette County's cost of living is 21.3% above the national average. The unemployment rate in Fayette County is 3.4%, which is below the State average of 4.1% and the National average of 4.0%. Fayette County has a median household income of \$84,861, which is well above the national average of \$51,914.

The ten largest private employers in Fayette County are:

| Company | Product/Service |
|-------------------------------------|--------------------------------------|
| Alenco Window GA, LLC | Window Manufacturing |
| Brent Scarborough & Company, Inc. | Construction Services |
| Fayette Community Hospital, Inc. | Healthcare |
| Hoshizaki America, Inc. | Food Service Equipment Manufacturing |
| Infiniti HR | Human Resource Management |
| Matsushita Electric Corp of America | Electronic Consumer Products |
| Publix Super Markets, Inc. | Grocery |
| The Kroger Company | Grocery |
| Trulite Glass & Aluminum Solutions | Glass & Aluminum Solutions |
| Walmart | Department Store/Retail |

The above list is in alphabetical order, not in order of company size.

This data is according to the Georgia Department of Labor, 2019.

Government

The form of government specified in the County Charter is known as Commission-Administrator form of government, which provides for an elected body of Commissioners, one from each of five geographic districts, who are elected in staggered four-year terms and a County Administrator to oversee the day to day management of the County. Although each County Commissioner is elected as a representative from their respective districts, they represent the interests of the entire county and all its citizens.

The main duties of the Board of Commissioners is to pass local laws, known as ordinances, that regulate a variety of things that promote the health, safety and welfare of the citizens covered by them; to pass a balanced budget each year that funds its own operations as well as to allocate funds to the four Constitutional Officers, other elected officials, the courts and a variety of programs put in place by the State but funded locally; to ensure that necessary services are funded and provided; to set the millage rate for the County government and many other secondary duties.

The Board of Commissioners sets the County millage rate each year to fund a portion of the County budget. They also receive the millage rate that is set by the Board of Education and an assessment by the State which is submitted to the Georgia Department of Revenue each year.

The Board receives, deliberates, and passes local ordinances each year and amends many others to reflect the changing times. Both require that a public hearing be held, and these are normally held during the regular Commission meetings. They also pass several resolutions and proclamations throughout the year. Generally, with some exceptions, the Board can pass any local law and ordinance they feel is needed for the County so long as it does not violate the laws of the State or Federal government or the Constitutional rights of any individual. These are researched thoroughly by legal staff before ever being brought to a hearing.

The Board of Commissioners provide many services that citizens expect through the revenues that are raised annually. These include Fire and Ambulance protection; E-911 dispatch services; Zoning and Planning; Inspections; Code Enforcement; Animal Control; Public Library; Public Works; and agencies that service all of these such as Building Maintenance, Vehicle Maintenance, and Emergency Management Services. The budget also funds state mandated services such as Law Enforcement and Detention; Superior, Probate, Magistrate and Juvenile courts; Tax Assessment and Tax Collection services; Elections management; District Attorney (shared with other counties) and some smaller funding for local agencies under the State of Georgia.

Transportation

Fayette County's transportation system consists primarily of state highways and county-maintained roads. State highways 54, 74, 85, 92, 279, and 314 are major transportation routes that carry the majority of passenger and commercial traffic in and out of Fayette County. Congestion in these transportation corridors create traffic problems, primarily because of population growth. There are no interstate, federal highway, or mass transit systems servicing Fayette County.

There are currently no passenger or freight rail services in Fayette County.

Atlanta Regional Airport, near Peachtree City, has one paved 5000-foot runway that services charter and private aircraft. There are no commercial flights into or out of Atlanta Regional Airport. Additionally, Fayette County has five private airfields.

Climate

Fayette County, like much of Georgia, enjoys a temperate climate with four well-defined seasons: warm to hot summers; brisk fall temperatures; relatively brief, cool winters; and a warm spring season. As a result, there exists a long growing season in Georgia, perfect for ornamental and economic-boosting agricultural plants.

AVERAGE MONTHLY TEMPERATURES IN GEORGIA (FAHRENHEIT)

| Month | Average Georgia Temperature | Average Fayette County Temperature |
|-----------|-----------------------------|------------------------------------|
| January | 46 | 43 |
| February | 49 | 45 |
| March | 56 | 54 |
| April | 63 | 62 |
| May | 70 | 69 |
| June | 77 | 77 |
| July | 80 | 78 |
| August | 79 | 78 |
| September | 74 | 72 |
| October | 64 | 61 |
| November | 56 | 51 |
| December | 48 | 47 |

Utilities

Fayette County's utility needs are met by a variety of public and private entities.

Electrical power in Fayette County is provided by the Coweta-Fayette Electric Membership Corporate, which provides approximately 70% of the county's electrical service, and Georgia Power, which provides the remaining 30%.

Propane and natural gas are the primary sources of heating and cooking fuel for Fayette County's residents. Atlanta Gas Light is the primary natural gas provider in Fayette County. Some areas of Fayette County remain reliant on the delivery of propane as a fuel source for heat and cooking.

Fayette County has both private and public water systems. The Fayette County Water System is a public utility and is the largest water provider in the county. The system provides drinking water and water for fire protection for part of unincorporated Fayette County, Tyrone, Brooks, Woolsey, and Peachtree City. This system has a pumping capacity of 18 million gallons per day. The City of Fayetteville provides water and sewage services for their jurisdiction. Peachtree City Water and Sewer Authority provides sewage services to Peachtree City.

Fayette County has four large reservoirs which serve as the main water sources for the Fayette County Water System. Additionally, the City of Fayetteville has one reservoir and a variety of wells that serve as the main water sources for their water system.

Approximately 60% of Fayette County residents are connected either to a public or private pressurized water system. The remainder of citizens rely on wells located on their private property.

Municipalities

City of Fayetteville

Fayetteville, Georgia was established on March 28, 1823. This site was decided upon when the first grand jury chose land lot 123 of the 5th district. This designated property then became the county seat of Fayette County, which had been created in 1821. Later that year the state legislature enacted a law that incorporated Fayetteville as a town. Both Fayetteville and Fayette County are named for the Marquis De Lafayette, a French nobleman who aided Washington during the Revolutionary War.

Fayetteville grew considerably from the time of its incorporation until 1860. After recovering from the war and reconstruction, Fayetteville again began to grow and prosper. In 1888, the railroad running through Fayetteville that connected Atlanta to Fort Valley began operation. Also, in 1888, Fayetteville was reincorporated as a city by the Georgia General Assembly and its geographic area was extended in a one-mile radius from the courthouse that sat in the center of the city.

In 1892, Fayetteville was struck by a tornado, which killed 3 individuals and wounded many more. This event was widely written about in the Atlanta, Macon,

and Savannah newspapers. Many of the buildings that currently surround the historic courthouse in Fayetteville were also built around this time.

Fayetteville has been impacted by many natural disasters over the years, in addition to the 1892 tornado. Blizzards in 1917 and 1993, a tornado in 1891, an ice storm in 1973, and the flood of 1994 all directly impacted the City of Fayetteville.

Fayetteville is the county seat of Fayette County and hosts many of the county's government offices. It is also home to many areas of interest. These include the Historic Fayette County Courthouse, the Southern Ground Amphitheater, the Holliday-Dorsey-Fife House Museum, and the Historic Train Depot.

The City of Fayetteville is governed by a Mayor and five-person city council, who are all elected by the citizens of Fayetteville.

The City of Fayetteville provides the following services to its citizens: Administrative, Community Development, Building and Inspections, Economic Development, Fire Services, Police Services, Public Works, Solid Waste Disposal, Stormwater, and Water and Sewer Services.

City of Peachtree City

The area that is now Peachtree City was first settled by Woodland Era Indians about 12,000 years ago. In 1775 William McIntosh, Jr, son of a Scotsman and Creek Indian woman, was born. He later became Chief of the Lower Creek Indian tribes that lived in Georgia. McIntosh believed that the Indians and white settlers could live in peace. In 1821 he ceded Creek land to the Federal Government, part of which became Fayette County. McIntosh was killed by fellow tribesmen in 1825, after which his two wives and several of his children stayed for several months at the Ware plantation, located in what is now Peachtree City. In honor of Chief McIntosh, many towns and roads in Fayette County were originally given Scottish names. McIntosh High School is also named in Chief McIntosh's honor.

In the 1950s a group of real estate developers amassed over 12,000 acres in Fayette County to build a planned community. Peachtree City was chartered March 9, 1959. The city was planned to be developed into villages, each with its own shopping areas, recreational facilities, and elementary schools. Peachtree City's current villages are Aberdeen, Braelinn, Glenloch, Kedron, and Wilksmoor.

In the original plan Peachtree City was expected to have between 75,000 and 80,000 residents. In the mid-1970s, the Land Use Plan was revised to allow for between 40,000 and 50,000 residents.

Peachtree City has a large active adult and retiree population. Peachtree City has over 100 miles of multi-use paths and a robust golf cart-friendly transportation system.

Peachtree City is home to many local attractions. These include the Commemorative Air Force Dixie Wing Museum, “The Fred” Amphitheater, Lake McIntosh Park, and the Line Creek Brewing Company. Peachtree City has served as the backdrop for many movies and television shows. These include The Walking Dead, Sweet Home Alabama, and Joyful Noise.

The City of Peachtree City provides many services to its citizens. These include Administrative, Code Enforcement, Building Department, Engineering, Fire and EMS, Police Services, Planning and Development, Library, Public Works, Garbage and Recycling, and Recreation.

Peachtree City is governed by a mayor and four councilmembers who are elected by the citizens of Peachtree City.

Town of Brooks

Brooks, the southernmost community in Fayette County, lies near the former site of a Creek Nation village and trading post. Although nothing specific is known of the community's Creek history, numerous Indian artifacts can still be found in our freshly tilled soil. McIntosh Road, a principal town thoroughfare, follows the path used by the Creeks to travel from Coweta Town (now Columbus, Georgia) and Whitesburg (on the Chattahoochee River at the present Carroll and Coweta County line) to Indian Springs, south of present-day Jackson, in Butts County.

The community was first called Haistentown but was known as Sharon Grove by the 1840s. The Civil War interrupted work on a rail line linking northern Alabama and Tennessee to the ports of Savannah, Georgia. Grading for the line had been completed to neighboring Senoia by 1861, but work was halted during the War, and did not resume until after Appomattox. A local planter, Hillery Brooks (1806-1881), gave a lot to the railroad in 1871 for construction of a depot, with the stipulation that the station would bear his name. Thus, did the name “Brooks Station” come into use. The village name was shortened simply to “Brooks” in 1905.

Rail access brought growth to the tiny farming community in the late 1800s, and a vibrant downtown section was in place by the turn of the twentieth century. Several stores, a bank, a drugstore, cotton gins, gristmills, blacksmith shops, and other businesses were located here by 1910; however, the economy was based on cotton production. By the time the great Depression struck the rest of the country in October 1929, the rural South had been in dire economic straits for eight long years. To add insult to injury, Brooks suffered a catastrophic hailstorm in May 1933, which broke practically every windowpane and ruined practically every roof in town. Another storm at about the same time took down most of the town's telephone lines, so that the only telephones in town until the early 1950s were in the depot and in a downtown store.

After World War II, the booming growth of the aviation industry in nearby Atlanta significantly impacted the town. Airline employees began buying large tracts of local farmland in the late 1950s, and the area's population grew slowly but steadily over the next several decades. The town charter was reactivated in 1964 for the purpose of providing some basic services for residents of the community, and a mayor and council were elected.

Today, the Town of Brooks is governed by a mayor and five councilmembers. The Town of Brooks provides Administrative, sewer, and solid waste services to its citizens.

Town of Tyrone

Tyrone is in an area originally belonging to the Creek Indians. Scottish and Irish immigrants settled here in the late 1800s because it reminded them of the area around County Tyrone in Northern Ireland. Some of the homes built by those first settlers are still occupied by their descendants. It was initially named Tyrone by the Birmingham and Atlantic Railroad when they first laid tracks in 1907, just four years before the Town of Tyrone was incorporated in 1911.

The Town of Tyrone provides many services to its citizens. These include Administrative, Animal Control, Building Development, Environmental Services, Fire and EMS, Library, Planning & Zoning, Police Services, Public Works, Recreation, and Sanitation.

Tyrone is governed by a mayor and four councilmembers. Day-to-day operations are managed by the Town Manager, who is appointed by the Mayor and Town Council.

Town of Woolsey

In 1875, I. G. Woolsey, a doctor, minister, and former Civil War surgeon, bought the land. By an act of the Georgia State Legislature, Woolsey became a town on December 16, 1893, but until Dr. Woolsey made application for a post office in the 1880s, the town of fifty-five residents was affectionately called Woolseyville.

In the 1880s, Woolseyville developed into a corn and cotton town with a large cotton gin. In 1885, Woolsey had a post office and jail, or calaboose as it was called then. A bank was opened in 1907. In 1926, millinery and blacksmith shops, a gristmill, a buggy shop, cotton gins, doctors' offices, a drug store, and a local general store were part of the local scene. There was even a hotel, a library containing 500 books, and a one-room school with a stage. In later years, the school expanded to four classrooms and an auditorium.

In 1993, Woolsey celebrated its centennial.

Primarily a residential community, Woolsey offers a pastoral setting with quaint shops and small businesses, a fire station, the Woolsey Baptist Church Youth Annex, and Masonic Lodge. Today, one can find a contented and easeful way of life, far removed from the neighboring big city of Atlanta.

The Town of Woolsey is governed by a mayor and three councilmembers, which are elected by the citizens of Woolsey.

CHAPTER THREE – HAZARD PROFILES

Summary of Updates for Chapter Three

The following table provides a description of each section of this chapter, and a summary of the changes that have been made to the Fayette County Hazard Mitigation Plan 2015.

| Chapter 3 Section | Updates |
|-------------------------------------|---|
| Risk Assessment | <ul style="list-style-type: none"> Expanded the explanation of the Risk Assessment Added an explanation of each part of the Hazard Information |
| Natural Hazard Thunderstorms | <ul style="list-style-type: none"> Updated and consolidated hazard profile with new data Added hail hazard Content revised |

Risk Assessment

Requirement §201.6(c)(2)(i and ii)

Requirement §201.6(d)(3)

The Fayette County Hazard Mitigation Planning Committee conducted a comprehensive Threat and Hazard Identification and Risk Assessment (THIRA) for Fayette County and all municipalities. This assessment developed the hazard basis for this plan. The assessment includes the following components for each hazard:

1. *Hazard Identification*: The Fayette County Hazard Mitigation Planning Committee identified nine natural hazards and six technological hazards for this Hazard Mitigation Plan. This is an increase four natural hazards and four technological hazards from the previous iteration of the plan. Each hazard was identified using statistical data and records from a variety of sources. The list of hazards is based upon frequency, severity of impact, probability, potential losses, and vulnerability.
2. *Hazard Description*: Each hazard was described in detail. Many hazard descriptions came from the Georgia Hazard Mitigation Plan since many of the hazards that could impact the state could also potentially impact Fayette County.
3. *Profile of Hazards*: Each hazard was profiled as to how it could potentially impact Fayette County.
4. *Assets Exposed to the Hazard*: The plan considers critical facilities and infrastructure as part of the vulnerability assessment. This assessment determines the vulnerability of the municipalities and attempts to identify the populations most vulnerable to each hazard, although many have potential countywide impacts.
5. *Estimated Potential Losses*: Using critical facility and past history data, an estimation of potential losses due to a particular hazard event were determined.
6. *Land Use and Development Trends*: Land use trends were considered when determining the potential future impacts of each hazard. This is of importance regarding flooding and dam failure events.
7. *Multi-Jurisdictional Concerns*: Each jurisdiction was considered when determining the potential hazard impact.

At the second meeting of the Fayette County Hazard Mitigation Plan Update Committee, the attendees participated in a risk assessment of hazard for Fayette County. This risk assessment was based upon two primary factors: 1. How likely is a hazard to occur; 2. How prepared the committee meeting participants felt the community was for each hazard. This risk assessment relied on the committee meeting attendees to identify the hazards and then rank them by those two factors. As a result, the risk assessment could be skewed by the meeting participants, recency bias, and/or how the hazard would directly impact the organizations represented at this meeting. After additional discussion with the Fayette County Hazard Mitigation Plan Update committee at future meetings, the hazards in this chapter were the agreed upon list. Several of the hazards identified by the committee members were consolidated into expanded hazard descriptions. Those incorporations are notated in the below hazard ranking.

| Hazard | Likelihood Score | Preparedness Score | Total Score |
|-------------------------------|------------------|--------------------|-------------|
| Severe Thunderstorms | 81 | 0 | 81 |
| Flooding | 51 | 5 | 56 |
| Tornado | 27 | 29 | 56 |
| Severe Winter Weather | 40 | 8 | 48 |
| Terrorism | 3 | 42 | 45 |
| Pandemic* | 1 | 32 | 33 |
| Emergent Infectious Diseases* | 1 | 32 | 33 |
| Utility/Pipeline Failure** | 7 | 12 | 19 |
| Drought | 9 | 10 | 19 |
| Hazardous Materials Incident | 0 | 17 | 17 |
| Earthquake | 0 | 14 | 14 |
| Transportation Incident*** | 5 | 7 | 12 |
| Tropical Cyclone | 6 | 5 | 11 |
| Extreme Temperatures | 9 | 0 | 9 |
| Dam Failure | 3 | 5 | 8 |
| Wildfire | 1 | 7 | 8 |
| Infrastructure Failure*** | 1 | 4 | 5 |
| Sinkhole | 0 | 3 | 3 |
| Meteor**** | 0 | 1 | 1 |
| Smog***** | 0 | 0 | 0 |

* Pandemic and Emergent Infectious Diseases were combined into a single hazard

** Utility/Pipeline Failure was renamed “Infrastructure Failure” to be all encompassing

***Infrastructure Failure, as identified by the Committee, was in relation to the failure of roads and bridges. As such, it was combined with Transportation Incident to cover all primary roadway hazards under one heading

**** After discussion, Meteor was removed due to low probability and lack of applicable mitigation strategies

***** After discussion, Smog was removed as a hazard

Natural Hazard: Thunderstorms*Hazard Description*

This section provides general and historical information about thunderstorms, including high wind, lightning, and hail. Other elements of thunderstorms, such as tornadoes and flooding, are addressed in their own sections.

Thunderstorms are formed when moist air near the earth's surface is forced upward through some catalyst (convection or frontal system). As the moist air rises, the air condenses to form clouds. Because condensation is a warming process, the cloud continues to expand upward. When the initial updraft is halted by the upper troposphere, both the anvil shape and a downdraft form. This system of up-drafting and down-drafting air columns is termed a "cell."

As the process of updrafts and downdrafts feeds the cell, the interior particulates of the cloud collide and combine to form rain and hail, which falls when the formations are heavy enough to push through the updraft. The collision of water and ice particles within the cloud creates a large electrical field that must discharge to reduce charge separation. This discharge is the lightning that occurs from cloud to ground or cloud to cloud in the thunderstorm cell. In the final stage of development, the updraft weakens as the downdraft-driven precipitation continues until the cell dies.

Each thunderstorm cell can extend several miles across its base and to reach 40,000 feet in altitude. Thunderstorm cells may compound and move abreast to form a squall line of cells, extending farther than any individual cell's potential.

Natural Hazard: Thunderstorms*(Hazard Description Continued)*

In terms of temporal characteristics, thunderstorms exhibit no true seasonality in that occurrences happen throughout the year. Convectively, driven systems dominate the summer while frontal driven systems dominate during the other seasons. The rate of onset is rapid in that a single cell endures only 20 minutes. However, various cells in different stages of development may form a thunderstorm that lasts up to a few hours as it moves across the surface.

In terms of magnitude, the National Weather Service defines thunderstorms in terms of severity as a severe thunderstorm that produces winds greater than 57 mph and/or hail of at least 1 inch in diameter and/or a tornado. The National Weather Service chose these measures of severity as parameters more capable of producing considerable damage. Therefore, these are measures of magnitude that may project intensity.

Lightning

Lightning occurs when the difference between the positive and negative charges of the upper layers of the cloud and the earth's surface becomes great enough to overcome the resistance of the insulating air. The current flows along the forced conductive path to the surface (in cloud to ground lightning) and reaches up to 100 million volts of electrical potential. In Georgia, lightning strikes peak in July, with June and August being second highest in occurrence.

Hail

Hail is a form of precipitation that forms during the updraft and downdraft-driven turbulence within the cloud. The hailstones are formed by layers of accumulated ice (with more layers creating larger hailstones) that can range from the size of a pea to the size of a grapefruit. Hailstones span a variety of shapes but usually take a spherical form. Hailstorms mostly endanger cars but have been known to damage aircraft and structures.

Hazard Profile

Severe thunderstorms, including high winds, hail, and lightning, are a serious threat to the residents and infrastructure of Fayette County. Severe thunderstorms are the most frequently occurring natural hazard in Fayette County. Many of these storms include high winds, lightning, and hail. Hail up to 4.5 inches was recorded in Fayette County on several occasions, most recently in 1988. Thunderstorm winds of 85 mph have been reported on many occasions in Fayette County, with the most recent occurring in 2015. While there have been dozens of documented thunderstorm events affecting Fayette County over the last 50 years, it is likely that the official number is a low estimate due to poor record keeping in decades past.

Natural Hazard: **Thunderstorms**

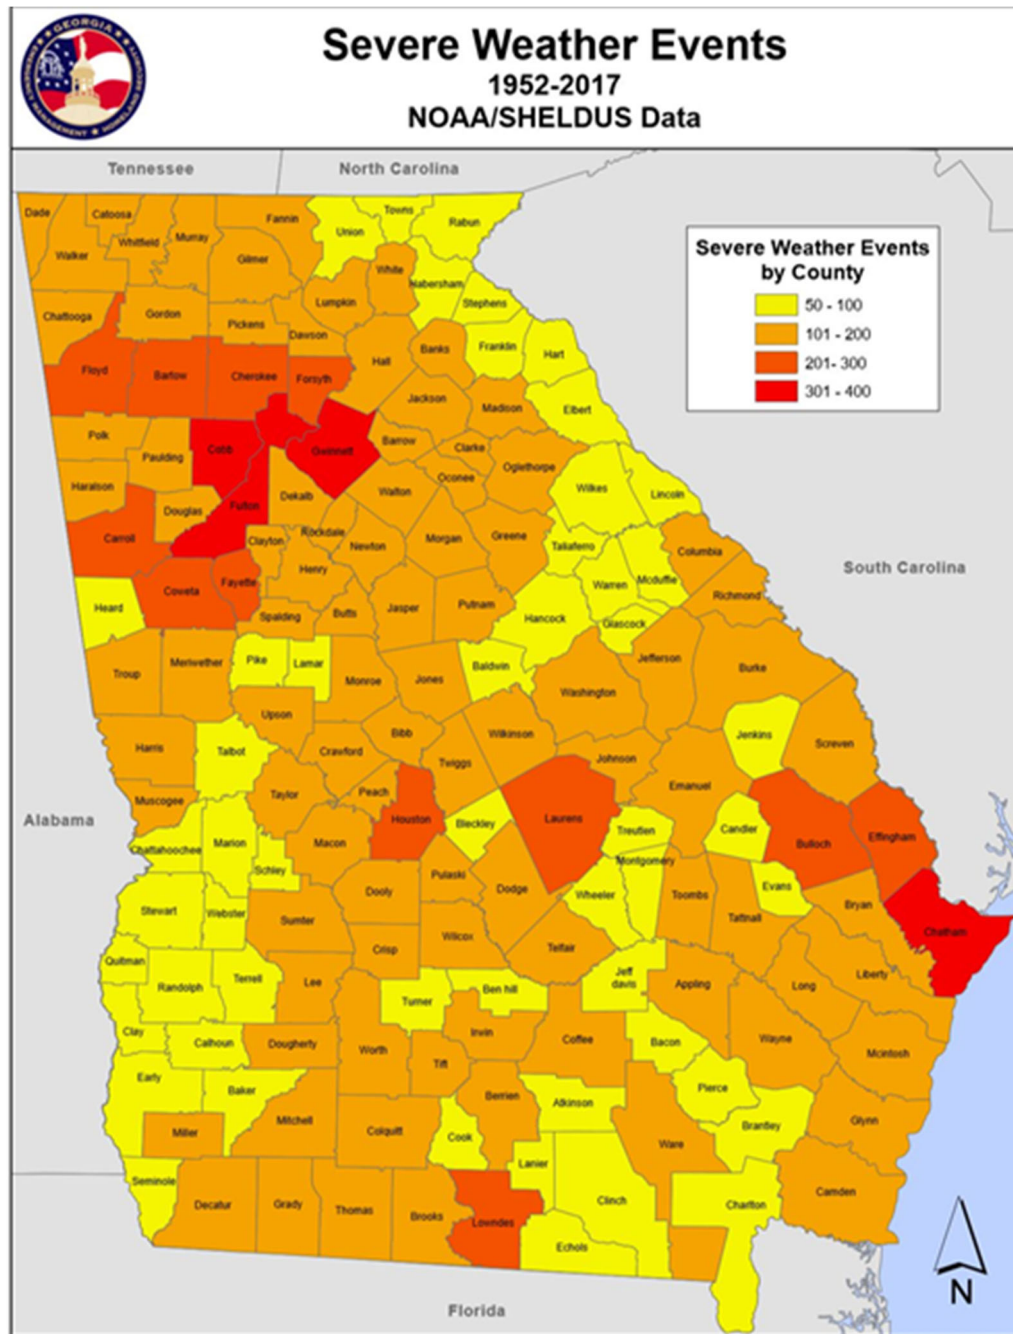

For example, only 23 thunderstorm events were recorded between 1970 and 1990, likely a vast underestimation of actual events.

| Hailstone size | Measurement | | Updraft Speed | |
|--------------------|-------------|--------|---------------|------|
| | in. | cm. | mph | km/h |
| bb | < 1/4 | < 0.64 | < 24 | < 39 |
| pea | 1/4 | 0.64 | 24 | 39 |
| marble | 1/2 | 1.3 | 35 | 56 |
| dime | 7/10 | 1.8 | 38 | 61 |
| penny | 3/4 | 1.9 | 40 | 64 |
| nickel | 7/8 | 2.2 | 46 | 74 |
| quarter | 1 | 2.5 | 49 | 79 |
| half dollar | 1 1/4 | 3.2 | 54 | 87 |
| walnut | 1 1/2 | 3.8 | 60 | 97 |
| golf ball | 1 3/4 | 4.4 | 64 | 103 |
| hen egg | 2 | 5.1 | 69 | 111 |
| tennis ball | 2 1/2 | 6.4 | 77 | 124 |
| baseball | 2 3/4 | 7.0 | 81 | 130 |
| tea cup | 3 | 7.6 | 84 | 135 |
| grapefruit | 4 | 10.1 | 98 | 158 |
| softball | 4 1/2 | 11.4 | 103 | 166 |

Most of the available information relating to severe thunderstorm events in Fayette County fails to describe damage estimates in any detail. With each thunderstorm event, there are likely unreported costs related to infrastructure costs, public safety response costs, utility repair costs, and personal home and business repair costs. Thunderstorms have occurred during all parts of the day and night and in every month in Fayette County.

The Fayette County Hazard Mitigation Plan Update Committee utilized data from the National Climatic Data Center, the National Weather Service, numerous weather-related news articles, and the Fayette County LEOP in researching severe thunderstorms and their potential impacts on the county. All information has been gathered on a countywide basis. All thunderstorm hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction.

Natural Hazard: **Thunderstorms**

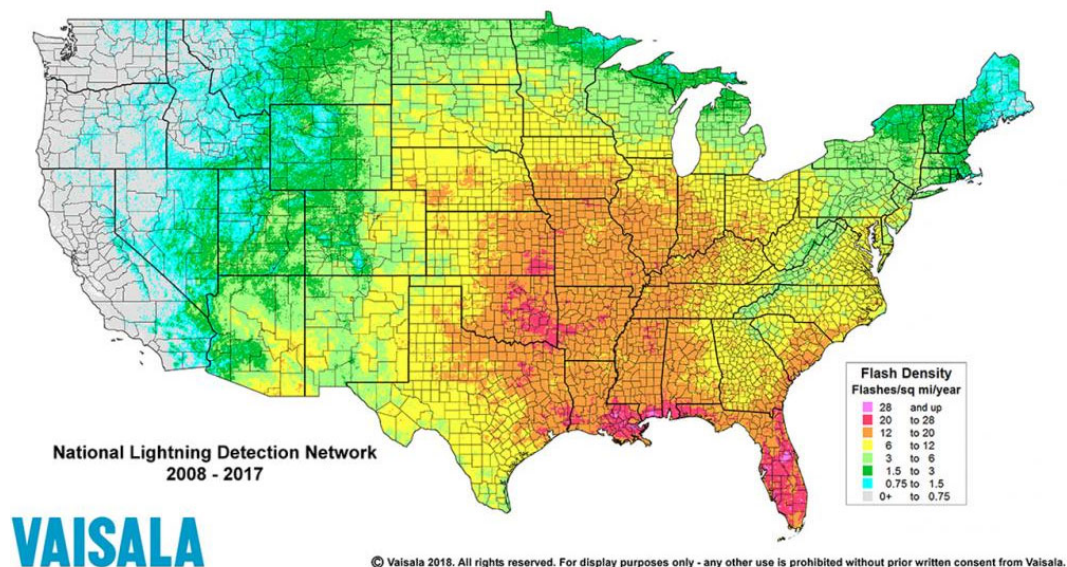

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

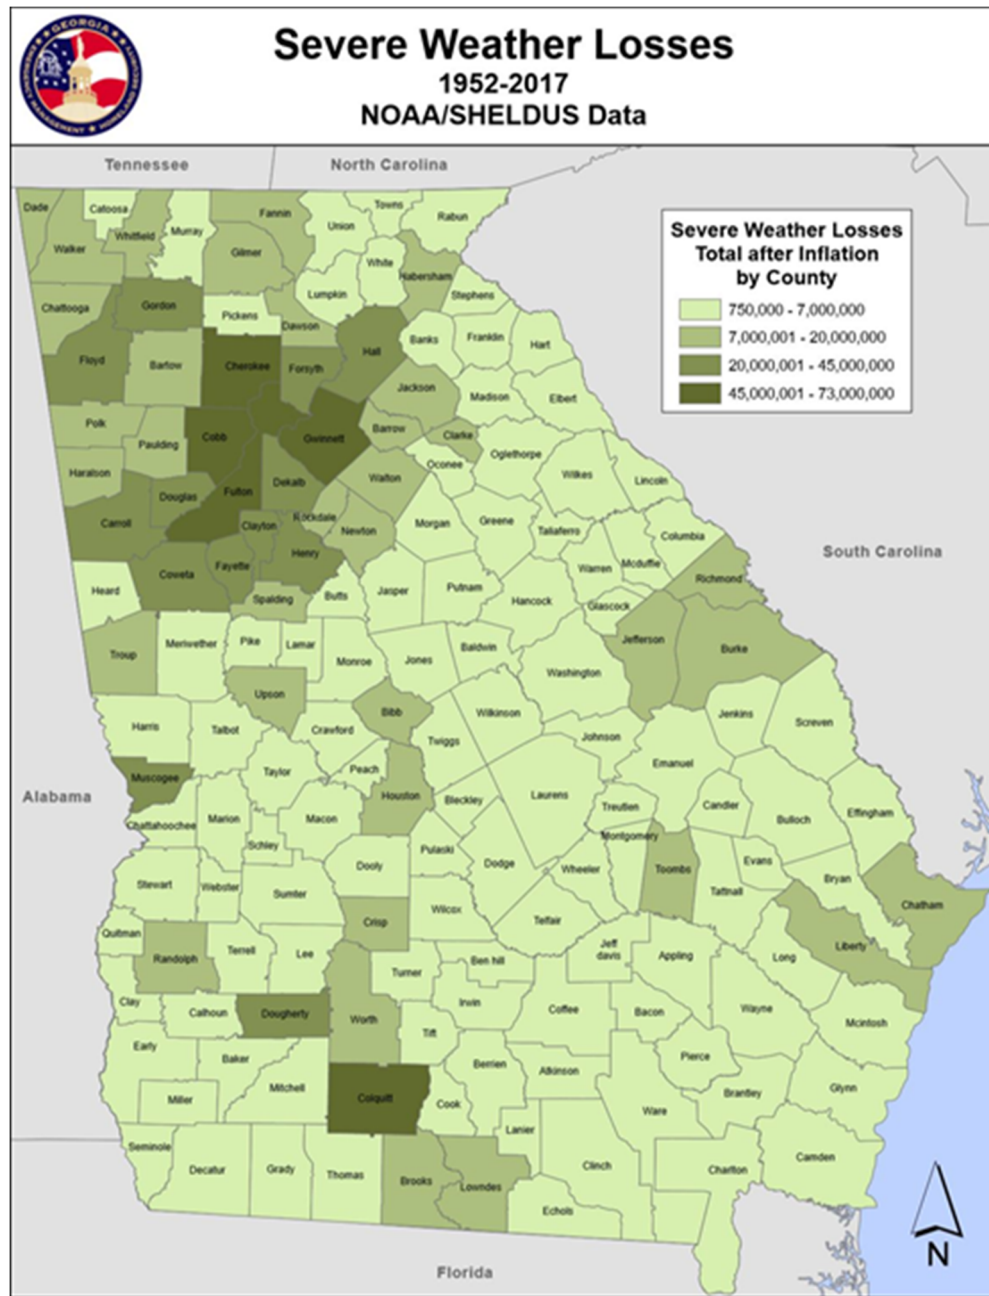

Natural Hazard: Thunderstorms*(Hazard Profile Continued)*

During the last 50 years, 214 thunderstorm events were recorded in Fayette County, with 191 of those occurring in the last 30 years. This number includes 74 hail events and only 47 lightning reports. According to these records, Fayette County has a 1.95% daily chance of a thunderstorm event based upon data from the last 30 years. Over the last 10 years, Fayette County has averaged 5.9 thunderstorm events per year (59 events). Due to improved record keeping protocols, the Fayette County Hazard Mitigation Plan Update Committee believes the data from the last ten years provides a more accurate representation of the thunderstorm threat to the county. The Fayette County Hazard Mitigation Plan Update Committee has also determined that the lightning threat is severely under-reported, as shown in the NCDC data numbers. For additional historical data, please see Appendix D.

As indicated by the below graphics, Fayette County averages between 6 and 12 flashes of cloud to ground lightning per square mile per year. That equals a 1.6% to 3.3% chance of a cloud-to-ground lightning strike on any given day. This shows a much higher indication of lightning occurrences than has been reported to the National Weather Service and the National Climatic Data Center. It is the determination of the Fayette County Hazard Mitigation Plan Update Committee that this data shows a more accurate representation of the scope of the threat that lightning poses to the citizens and infrastructure of Fayette County.

Natural Hazard: **Thunderstorms**

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Thunderstorms

Severe thunderstorm winds, which are defined as winds of at least 58 mph in conjunction with a convective event, have occurred with many thunderstorms that have affected Fayette County. These winds can exceed 100 mph and cause damage comparable to weak tornadoes. Below are two maps that identify the wind risk and the hazard wind score for the State of Georgia, including Fayette County. The Hazard Wind Score maps use the following scale:

| Hazard Score | Wind Speeds |
|---------------------|--------------------|
| 1 | <90 mph gust |
| 2 | 91 – 100 mph gust |
| 3 | 101 – 110 mph gust |
| 4 | 111 – 120 mph gust |
| 5 | >120 mph gust |

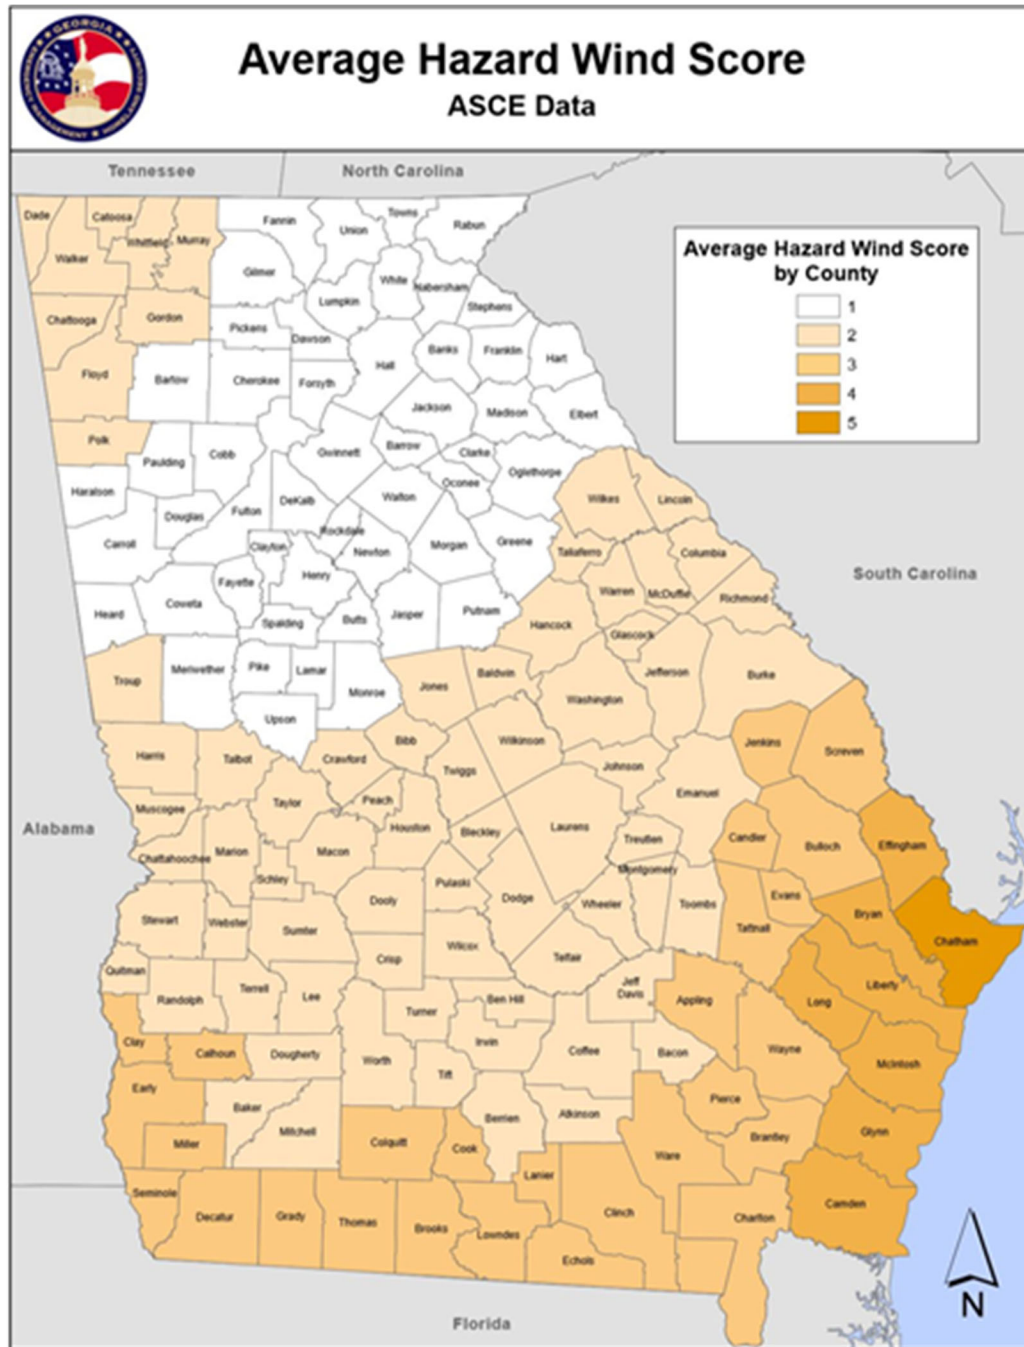

| <i>Municipality</i> | <i># of Thunderstorms</i> | <i>Annual Risk</i> |
|--|---------------------------|--------------------|
| BROOKS | 10 | 40% |
| FAYETTEVILLE | 65 | 100% |
| PEACHTREE CITY | 58 | 100% |
| TYRONE | 22 | 88% |
| WOOLSEY | 4 | 16% |
| COUNTYWIDE/ UNINCORPORATED AREA | 43 | 100% |

This Table identifies the number of Thunderstorms for municipalities over the last 25 years

Assets Exposed to the Hazard

In evaluating assets that are susceptible to severe thunderstorms, the Fayette County HMPC determined that all public and private property is at threat by severe thunderstorms, including all critical facilities. This is due to the lack of spatially prejudice of severe thunderstorm events.

Natural Hazard: **Thunderstorms**

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: **Thunderstorms**

Natural Hazard: Thunderstorms*Estimated Potential Losses*

Estimates of damage for the past events of the last 50 years are over \$23.6 million, or \$473,050 annually. However, all estimated damages reported have occurred over the last 25 years. When extrapolated over 25 years, the annual average doubles to \$946,080. These numbers are thought to be a gross underestimation of actual past damages.

Land Use & Development Trends

Fayette County currently has no land use trends related to Thunderstorms beyond continued population growth – particularly around the Cities of Peachtree City and Fayetteville and along

Multi-Jurisdictional Considerations

Thunderstorm events have occurred across all areas of Fayette County. Crop damage from thunderstorm events would likely have the greatest impact in the rural areas of Fayette County. However, property damage numbers would be highest in more heavily populated areas due to greater population density. Thunderstorms have the potential to impact all areas of Fayette County.

Hazard Summary

Thunderstorm events pose one of the greatest threats of property damage, injuries, and loss of life in Fayette County. Thunderstorm events are the most frequently occurring weather event that threatens Fayette County. As a result, the Fayette County HMPC recommends that the mitigation measures identified in this plan for thunderstorms should be aggressively pursued due to the frequency of this hazard and the ability for this hazard to affect any part of Fayette County.

Natural Hazard: Winter Storms*Hazard Description*

Severe winter storms bring the threat of ice and snow. There are many types of frozen precipitation that could create a severe winter weather event. Freezing rain consists of super cooled falling liquid precipitation freezing on contact with the surface when temperatures are below freezing. This results in an ice glazing on exposed surfaces including buildings, roads, and power lines. Sleet is easily discernable from freezing rain in that the precipitation freezes before hitting the surface. Often this sleet bounces when hitting a surface and does not adhere to the surface. However, sleet can compound into enough depths to pose some threat to motorists and pedestrians.

A heavy accumulation of ice, which is often accompanied by high winds, can devastate infrastructure and vegetation. Destructiveness in the southern states is often amplified due to the lack of preparedness and response measures. Also, the infrastructure was not designed to withstand certain severe weather conditions such as weight build-up from snow and ice. Often, sidewalks and streets become extremely dangerous to pedestrians and motorists. Primary industries, such as farming and fishing, suffer losses through winter seasons that produce extreme temperatures and precipitation.

Within Georgia, the impacts of winter storms are often contained within the northern part of the State. However, events like the 1993 “storm of the century” illustrated the vast impacts that one storm can have on the entire state. The winter storms with the greatest impacts on Georgia are the result of coastal storms coming up from the Gulf of Mexico, including the winter storms in 1973 and 1993. The 1973 storm produced snowfalls of up to 19 inches in parts of Central Georgia including the City of Thomaston in Upson County. Also, a major ice storm occurred in 2014, bringing up to 1 inch of ice to the eastern portion of the State near Augusta.

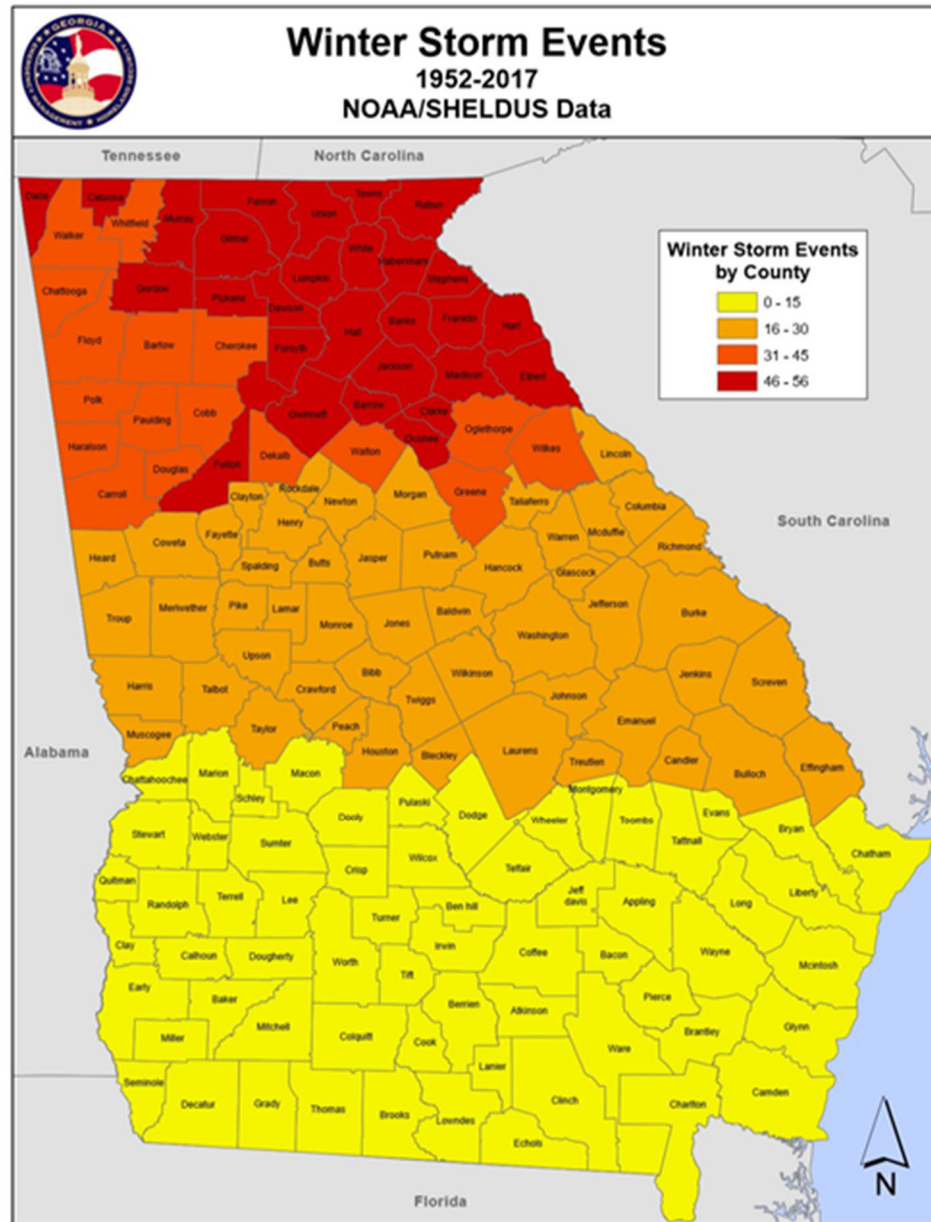

Severe winter weather exhibits seasonal qualities in that most occur within the months of January to March, with the highest probability of occurrence in February. The rate of onset and duration varies from storm to storm, depending on the weather system driving the storm. Severe winter weather rarely frequents the State of Georgia. However, the impacts of the storms substantiate severe winter weather’s inclusion in the risk assessment.

Hazard Profile

While winter storms are not as frequent of an occurrence in Fayette County as they are in areas in the Northern US, they still have the potential to wreak havoc on the community when they do occur. Winter storms in Fayette County typically cause drastic damage to infrastructure, such as roads, power lines, and bridges. They also

Natural Hazard: Winter Storms

can cause damage to private property, businesses, and trees throughout the county. Due to the county's elevation changes, many highways have steep grades that can become dangerous during icy conditions. The large number of trees in Fayette County can also become a hazard when the tree limbs become weighed down with snow and ice and begin to break and fall to the ground, potentially damaging private property, public property, or injuring people and animals.

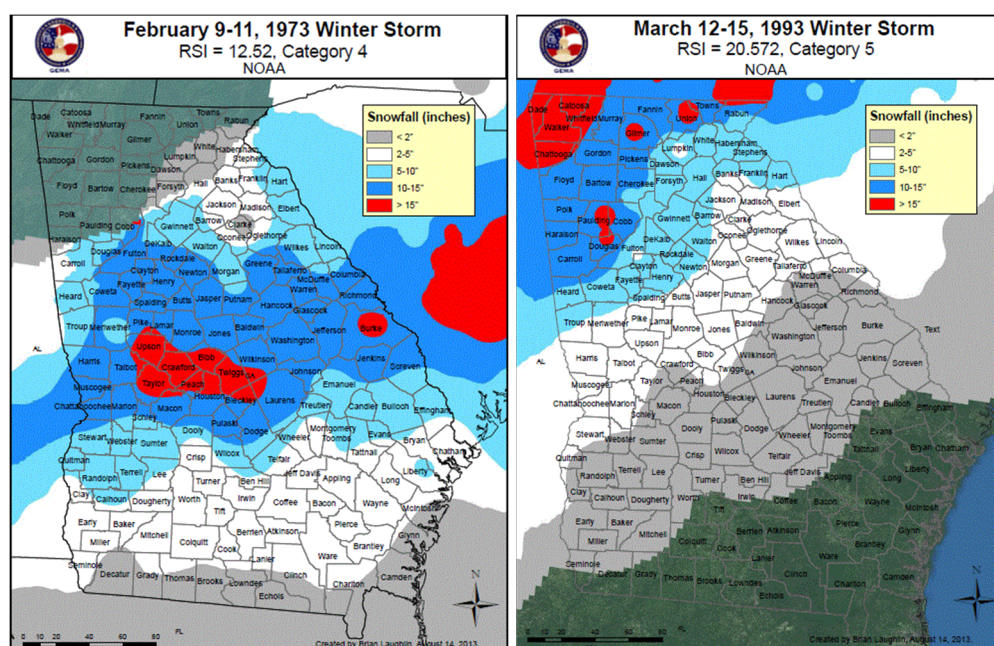

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Winter Storms*(Hazard Profile Continued)*

During the past twenty-three years, documentation exists for 24 winter storm events in Fayette County. No consolidated data can be located prior to this timeframe. On average, Fayette County has averaged 1.04 winter storms per year. Due to improved record keeping techniques, the HMPC believes that looking at the record for the last 20-year period provides a more accurate representation of the threat of winter storms for Fayette County. All winter storm data has been gathered on a countywide basis. For additional historical data, please see Appendix D. All winter storm hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction.

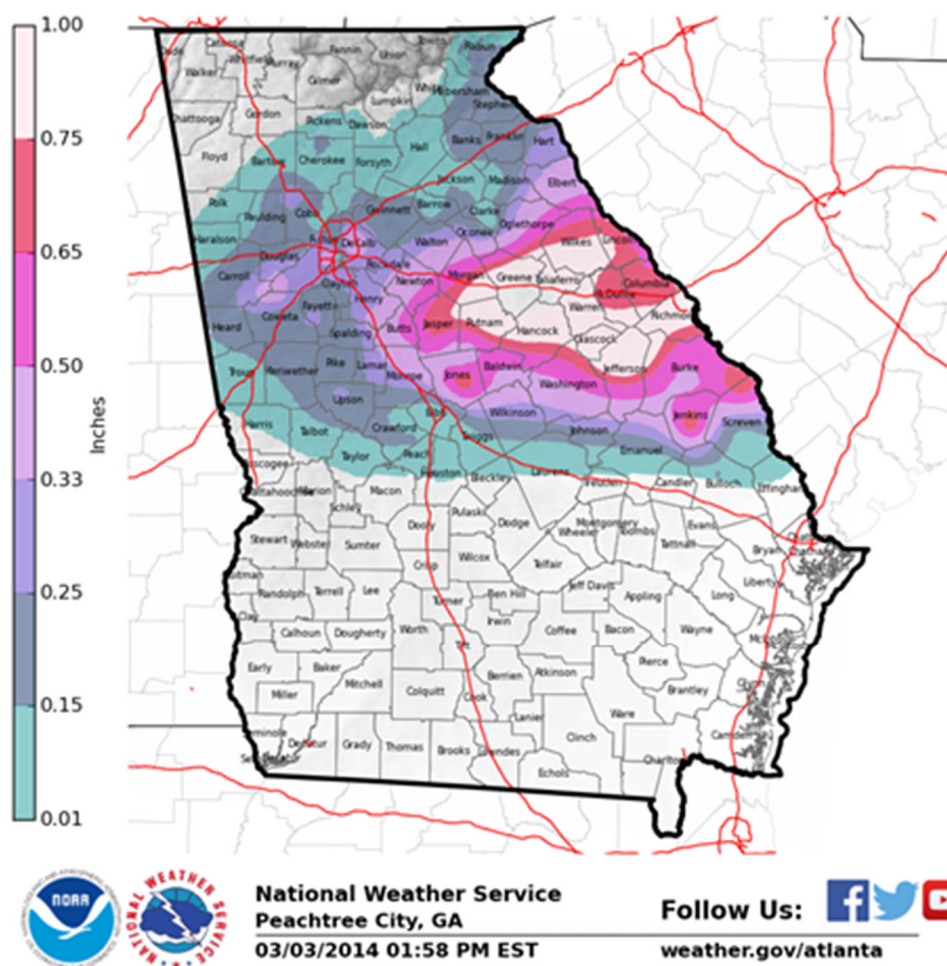

Individual events of Winter Weather can be drastically different depending on many factors, including the duration of the event, the type of precipitation involved, and the depth of the precipitation. Winter Storm events can be a light dusting of snow, $\frac{1}{4}$ inch of ice, or over a foot of snow. Other factors, such as wind, can influence the strength of these events, as happened with wind-blown snow during the March 1993 Winter Storm event. During the 1973 snow event, parts of Fayette County reported up to 15 inches of snow and all areas received at least 10 inches of snow.

Source: 2014 State of Georgia Hazard Mitigation Strategy (most up-to-date version)

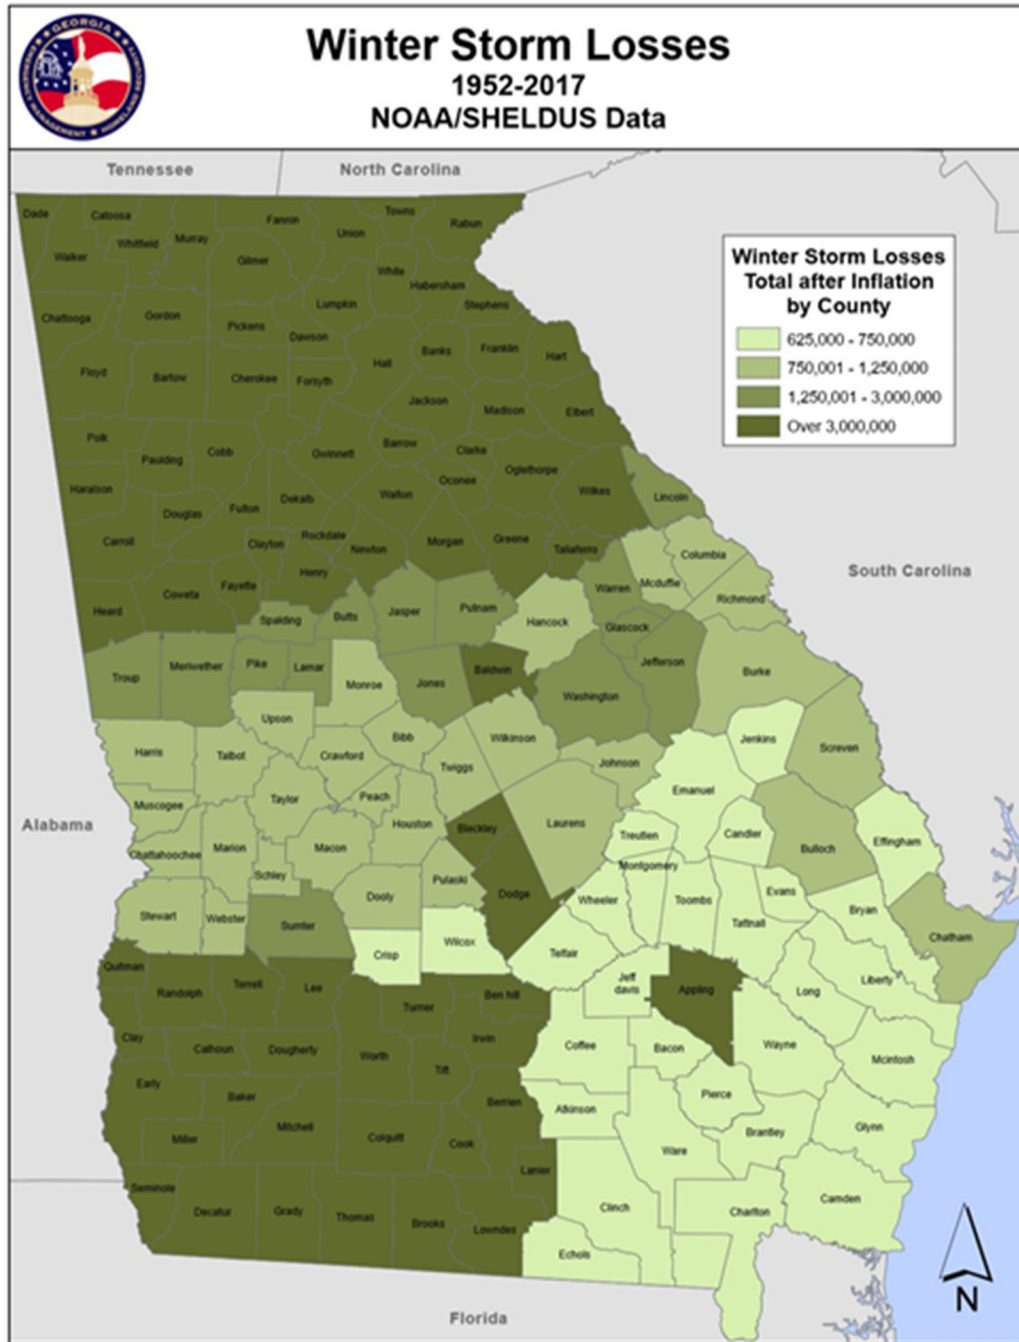

Natural Hazard: Winter Storms

Ice events are another type of winter storm that has impacted Fayette County in the past. These types of winter storms can be particularly crippling due to the increased threat of tree falls related to the weight of accumulated ice and subsequent utility infrastructure failure. The 2014 Ice Storm produced significant ice accumulations over much of North Central Georgia, including Fayette County. While areas farther east, such as Augusta, saw the greatest impacts, Fayette County had ice accumulations around 0.25 inch for most areas with an isolated pocket of 0.33 inch in the western part of the county. This storm led to widespread power outages with some residents without power for over two days.

Preliminary Ice Totals ending Feb. 13, 2014

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Winter Storms

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Winter Storms*Assets Exposed to the Hazard*

Since winter storms are indiscriminate regarding location, the Fayette County HMPC determined that all public and private property, including all critical infrastructure, are susceptible to impacts from winter storms.

Estimated Potential Losses

Total estimated losses for winter storm events of the last 50 years indicate a total of over \$1.3 million in losses. Extrapolated over 50 years, this averages out to \$26,360 per year. However, nearly all the documented winter storms with loss information have occurred over the last 20 years. As such, the average loss per year for the last 20 years is \$65,900 per year. It is estimated that these numbers are a gross underestimation of the impact of past winter storms and caution is expressed when using these figures to make loss determinations for winter storms in Fayette County.

Land Use & Development Trends

Fayette County currently has no land use trends related to Winter Storms beyond continued population growth – particularly around the Cities of Fayetteville and Peachtree City.

Multi-Jurisdictional Considerations

All portions of Fayette County could potentially be impacted by a winter storm, including freezing rain, sleet, and snow. Therefore, all mitigation actions identified regarding winter storms should be pursued on a countywide basis and including all municipalities.

Hazard Summary

Winter storms, which can include freezing rain, sleet, or snow, typically afford communities some advance warning, which is different from many other severe weather phenomena. The National Weather Service issues winter storm watches, advisories, and warnings as much as a day before the storm's impacts begin. Unfortunately, communities in the Southern United States are not equipped to handle winter storms due to their relative infrequent nature. Oftentimes, communities can face severe impact from these storms. The Fayette County HMPC recognizes the potential threats winter storms could have on the community and have identified specific mitigation actions as a result.

Natural Hazard: Flooding

Requirement §201.6(c)(2)(ii)

Requirement §201.6(c)(3)(ii)

Hazard Description

Flooding is a temporary overflow of water on normally dry lands adjacent to the source of water, such as a river, stream, or lake. The causes of flooding include mass sources of precipitation, such as tropical cyclones, frontal systems, and isolated thunderstorms combined with other environmental variables, such as changes to the physical environment, topography, ground saturation, soil types, basin size, drainage patterns, and vegetative cover. Adverse impacts may include structural damages, temporary backwater effects in sewers and drainage systems, death of livestock, agricultural crop loss, loss of egress and access to critical facilities due to roads being washed-out or over-topped and unsanitary conditions by deposition of materials during recession of the floodwaters.

Floods are loosely classified as either coastal or riverine. Coastal flooding occurs when normally dry, low-lying land is flooded by sea water. Coastal flooding is usually associated with tropical cyclones in Georgia. Riverine flooding occurs from inland water bodies such as streams and rivers. Riverine flooding is often classified based on rate of onset. The first is slow to build, peak, and recede, often allowing enough time for evacuations. The other type of riverine flood is referred to as a “flash” flood, which rapidly peaks and recedes, thus giving insufficient time for evacuations. Flash floods are typically considered the most dangerous of these types.

On a broad scale, flooding can occur around any body of water or low-lying surface given enough precipitation or snowmelt. The spatial extent of the flooding event depends on the amount of water overflow but can usually be mapped because of existing floodplains (areas already prone to flooding).

Flooding in Georgia is highly dependent on precipitation amounts and is highly variable. Certain seasons are more prone to flooding to a greater likelihood of excessive precipitation. Typically, the wet seasons are during the winter, early spring, and midsummer. Late spring and fall are usually drier seasons.

Hazard Profile

The Fayette County HMPC researched flooding information for the last fifty years. The main sources of information used by the Fayette County HMPC came from the National Climatic Data Center, the Fayette County Emergency Operations Plan, and news media sources. It was determined that flooding has caused

Natural Hazard: Flooding*(Hazard Profile Continued)*

significant damage on many occasions over the last 20 years. One significant flooding event that affected Fayette County occurred in 2015. This event caused over \$1 million in reported damages. Most of the damages associated with this event were related to Whitewater Creek. The flood gage on Whitewater Creek at Starr's Mill hit 15.9 feet, which is nearly 6 feet above flood stage. Most of the Starr's Mill Park was flooded and several roads and culverts were washed out. One condo along Cherry Branch suffered damage because of floodwaters. While data was collected for the entire 50-year timeframe, little information was available regarding flood events over that period, possibly due to poor record keeping. All flood data was gathered on a countywide basis.

Flood events within Fayette County are typically associated with areas of special flood hazard as identified on Flood Rate Insurance Maps (FIRMs) published by FEMA. Relatively little information is available regarding flooding damage estimates. However, with each flooding event, it is likely that significant costs arose related to road repair, infrastructure repair, and public safety response operations. Most of the flood damage in Fayette County's history appears to be related to roads and culverts washing out because of flood waters. All flooding hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction.

Fayette County has many flood gages that provide information on potential impacted areas from floodwaters. The flood gage on Line Creek near Peachtree City indicates that flood stage is reached at 12 feet, which would lead to flooding in residential yards on Wynnmeade Parkway and Wynn's Pond. Lake McIntosh would begin to overflow its banks and flood low lying areas of the Planterra Ridge Golf Course. At 14 feet, floodwaters would continue to inundate wooded areas upstream and downstream from the gage and would begin to approach the foundations of several homes on Wynnmeade Parkway and Wynn's Pond. At 18 feet, Major Flood Stage is reached as floodwaters would reach 2-3 feet deep in several homes on Wynnmeade Parkway and Wynn's Pond. This river gage has a high mark of 15.03 in December of 2018. However, the gage has only been in place since 2009.

For Whitewater Creek at Starr's Mill, flood stage is reached at 10 feet, which is when woodlands and fields downstream from the Starr's Mill Dam begins to flood and the parking lot at Starr's Mill Park is under 1 foot of water. At 15 feet, Moderate Flood Stage is reached and most of Starr's Mill Park will be under 2-5 feet of water

Natural Hazard: Flooding

and the water will reach the bottom of Starr's Mill. At 17 feet, Major Flood Stage is reached as floodwaters begin to enter the building at Starr's Mill and most of the park will be under 5-7 feet of water. At 19 feet, the gage house would become inundated with water as Starr's Mill Park would be under 7-9 feet of water. This river gage has a high mark of 15.86 in December of 2015. However, the gage has only been in place since 2015.

The gage on Morning Creek north of Fayetteville provides additional information for how a flood might impact Fayette County and its residents. For this location, flood stage is reached at 14 feet. Minor flooding would begin along wooded areas upstream and downstream from the gage, which is located on Westbridge Road. The backyard of one home would begin to flood. At 18 feet, minor flood stage is reached, and waters would reach 2-5 feet in the backyard of one home. Water would also inundate the in-ground pool at this location and reach the foundation of the home. At 20 feet, the home's foundation would be under 2 feet of water and backyards would also begin to flood on Westbridge Circle and Westbridge Drive. At 23 feet, the water level on Morning Creek would reach the base of the bridge, which would likely lead to local authorities closing the road. One home would be flooded up to 5 feet on the lowest level and flood waters would also reach the foundation of several homes on Westbridge Circle and Westbridge Drive. At 26 feet, the creek would be two feet above major flood stage and portions of the bridge and roadway would be under 2 feet of water. Several homes off Westbridge Circle and Westbridge Drive would begin to flood and one home on Westbridge Road would be completely surrounded by floodwaters. This river gage has a high mark of 15.07 in December of 2015. However, the gage has only been in place since 2015.

The gage on the Flint River near Woolsey provides information for how a flood might impact Woolsey and its residents. While this gage is not in Woolsey, the floodwaters described at this location would have a significant indirect impact on the residents of Woolsey. At this location, flood stage is reached at 48 feet as water begins to infiltrate woodlands, pastures, and agricultural fields. At 50 feet, water reached the foundation of a Fayette County pump station to Lake Horton Reservoir. At 55 feet, Moderate flood stage is reached as water reaches within 1 foot of the bottom of the bridge on Hampton Woolsey Road and water begins to enter the pump station. At 58 feet, the bridge begins to form an obstacle, leading to backwater and erosion eddies. The road will likely be closed at this stage. At 60 feet, Major flood stage is reached and parts of Hampton Woolsey Road begin to flood. Around

Natural Hazard: Flooding

5 feet of water would be in the pump station and several outbuildings on nearby farms begin to flood.

Past flood events in the City of Fayetteville provide a glimpse into what potential impacts may look like in this jurisdiction. In 2002, a heavy rainfall event led to flooding at the Stonewall Village Complex. Two apartments had approximately 1 foot of water inside the apartment at the flood's peak. A car was also flooded in downtown Fayetteville as a result of this flood. Flood gage information just outside the city limits of Fayetteville indicate that flood waters would be at least 1 foot deep in Brookshire Drive and Sherwood Road due to flooding from Whitewater Creek when Major flood stage is reached (25 feet). This depth would lead to some homes on those roadways being inundated with up to 3 feet of water.

For the Town of Tyrone, most flooding is limited to periphery areas of the jurisdiction. However, homes on Chapparral Trace, Foxford Run, and Ridge Run could be inundated with up to 2-3 feet of water in a 100-year flood event. The water would be the result of flooding on Line Creek that backed up into the local tributary on which Smith Lake is build. Approximately 10 homes in this area and neighborhood would be directly impacted from a flood of this magnitude.

There are no 100-year floodplain areas within the Town of Brooks. Flooding in this municipality is limited to brief localized flooding of low-lying areas from heavy rainfall events. These events are generally minor inconveniences for the citizens of Brooks without lasting impacts.

There are 20 documented flood events over the last 50 years. Based on the 50-year record, it can be inferred that such an event is likely to occur every 2.5 years in Fayette County. This relates to a 40% chance of a flood event occurring in a given year. However, all identified flood events have occurred over the last 25 years. When extrapolated over 25 years, Fayette County has averaged a flood every 1.25 and has an 80% annual chance of a flood event occurring.

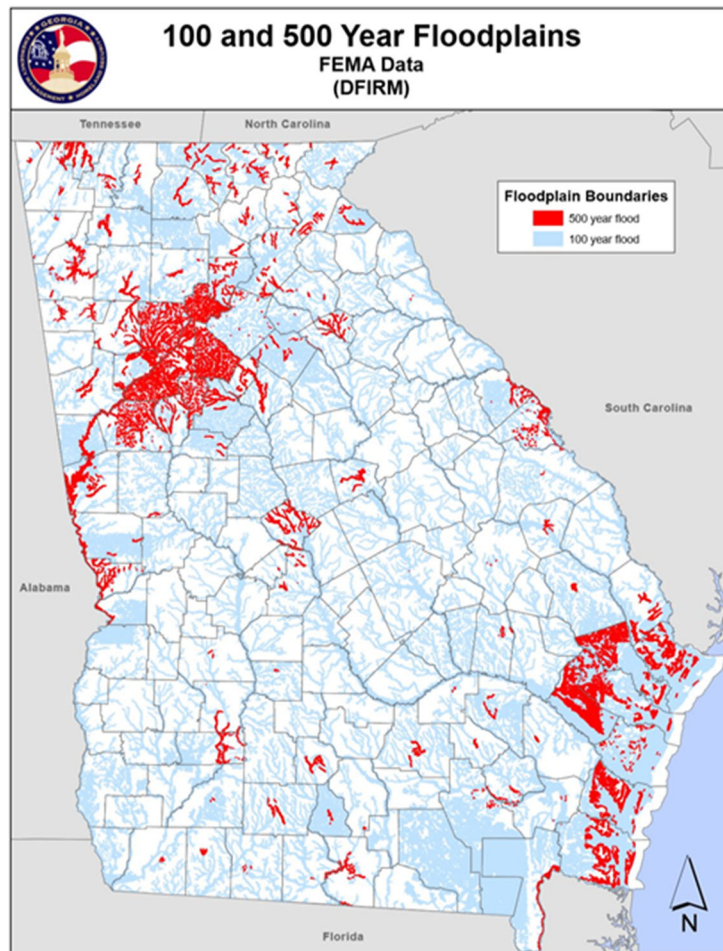

For additional historical data, please see Appendix D.

Assets Exposed to the Hazard

To evaluate the assets that would potentially be impacted by flooding, the Fayette County HMPC attempted to identify known structures within, or close to, the 100-year floodplain. There are approximately 245 buildings identified in the flood plain.

Estimated Potential Losses

The flooding events in Fayette County over the last 50 years have led to nearly \$2.5 million in damages. Extrapolated over 50 years, this results in an annual average of \$49,380 per year. However, all reported damages have occurred in the last 20 years. As a result, the average over the last 15 years is \$123,540 annually. These estimations are believed to be a gross underestimation of both prior and potential damages from flood events.

Natural Hazard: **Flooding**

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Flooding

Based upon the estimations from the Worksheet 3As located in Appendix E, a flood equivalent to the 1% riverine flood levels could result in estimated losses of more than \$70 million (245 buildings). However, it is possible that some areas may not experience total losses while others may be inundated with flood water who are not designated in the 1% riverine flood areas.

Land Use & Development Trends

Fayette County participates in the National Flood Insurance Program (NFIP) and follows the program's guidelines to ensure future development is carried out in the best interests of the public. The County (CID No. 130432) first entered the NFIP on July 5, 1983. According to the NFIP guidelines, the County has executed a Flood Damage Prevention Ordinance. This ordinance attempts to minimize the loss of human life and health as well as minimize public and private property losses due to flooding. The ordinance requires any potential flood damage be evaluated at the time of initial construction and that certain uses be restricted or prohibited based on this evaluation. The ordinance also requires that potential homebuyers be notified that a property is located in a flood area. In addition, all construction must adhere to the Georgia State Minimum Standard Codes and the International Building Codes. Currently, the Fayette County municipalities of Brooks, Fayetteville, Peachtree City, Tyrone, and Woolsey also participate in NFIP through the application of appropriate NFIP-compliant ordinances and regulations.

There are 11 repetitive loss residential properties identified in Fayette County. These properties total \$578,654 in assessed value.

Pinewood Studios, which is a major movie making studio located on Sandy Creek Road, could see significant impact from a 100-year (1% annual risk) flood event. The Studios would be essentially cut off as roadways surround Pinewood Studios would be inundated with water. Additionally, one of the studios at the Pinewood Studios complex would be directly impacted by flood waters. As development continues in this area, the overall risk and impact also increases.

Multi-Jurisdictional Considerations

During a large-scale flood event, many portions of Fayette County would potentially be impacted by flooding. However, the area's most prone to flooding have historically been those areas located within the 100-year floodplain – particularly those areas along Line Creek, Whitewater Creek, Morning Creek, and the Flint River and their tributaries and distributaries. All of Fayette County, including all municipalities, could potentially be impacted.

Natural Hazard: **Flooding***Hazard Summary*

Flooding has the potential to inflict significant damage within Fayette County, particularly along Line Creek, Whitewater Creek, Morning Creek, and the Flint River and their tributaries and distributaries. Mitigation of flood damage requires the community to be aware of flood-prone areas, including roads, bridges, and critical facilities. The Fayette County HMPC identified flooding as a hazard requiring mitigation measures and identified specific goals, objectives, and action items they deemed necessary to lessen the impact of flooding for their communities. Fayette County and its municipalities have implemented many mitigation strategies beyond ordinances and land use regulations in an attempt to curb flooding. These include the replacement of multiple culverts and bridges throughout Fayette County in areas that have seen significant flooding impacts in the past, such as Rising Star Road.

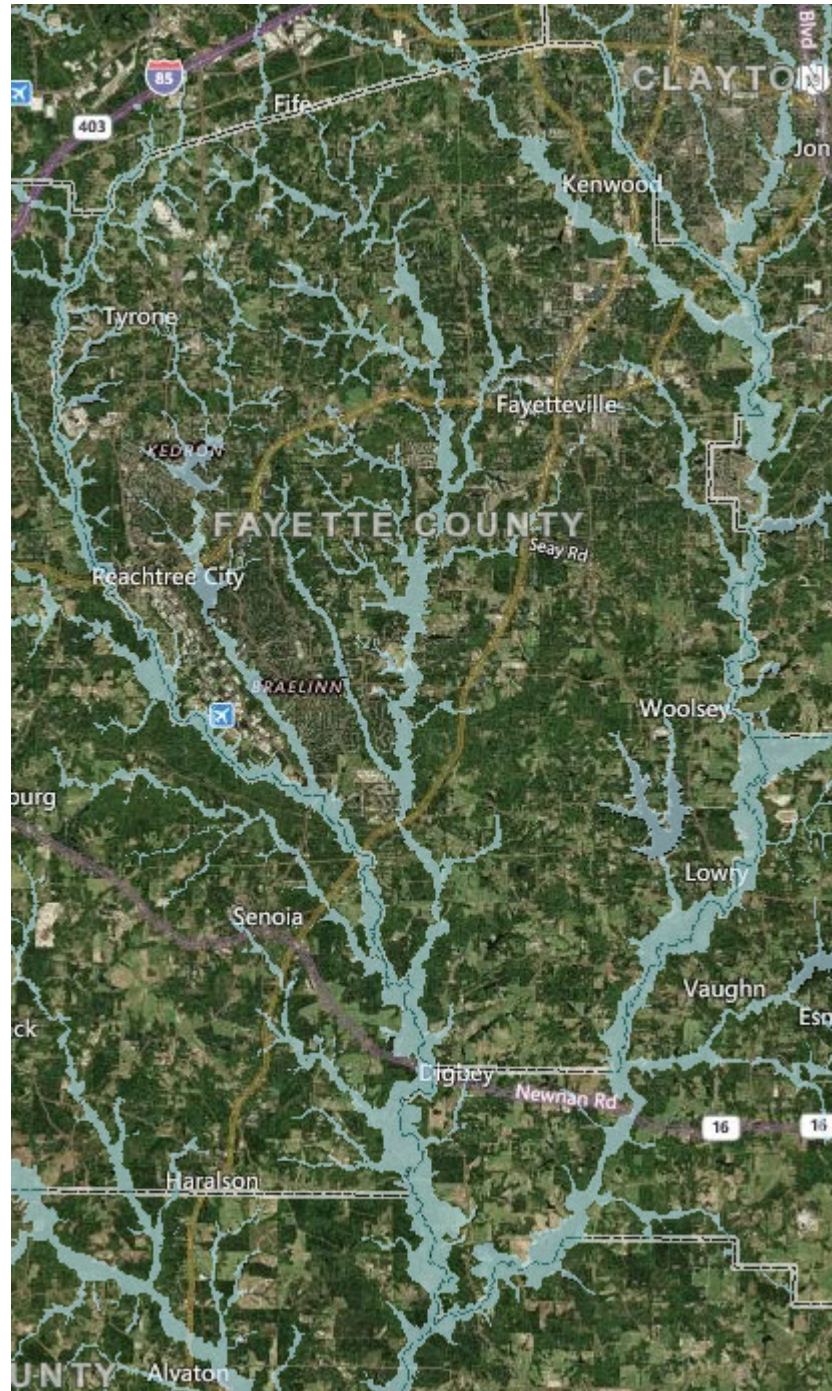

There are 11 repetitive loss properties identified in Fayette County.

Natural Hazard: Tornado*Hazard Description*

A tornado is a violently rotating column of air (seen only when containing condensation, dust, or debris) that is in contact with the surface of the ground. Exceptionally large tornadoes may not exhibit the classic “funnel” shape, but may appear as a large, turbulent cloud near the ground or a large rain shaft. Destructive because of strong winds and windborne debris, tornadoes can topple buildings, roll mobile homes, uproot vegetation, and launch objects hundreds of yards.

Most significant tornadoes (excluding some weak tornadoes and waterspouts) stem from the right rear quadrant of large thunderstorm systems where the circulation develops between 15,000 and 30,000 feet. As circulation develops, a funnel cloud, a rotating air column aloft, or tornado descends to the surface. These tornadoes are typically stronger and longer-lived. The weaker, shorter-lived tornadoes can develop along the leading edge of a singular thunderstorm. Although tornadoes can occur in most locations, most of the tornado activity in the United States in the Midwest and Southeast. Tornadoes can occur anywhere within the State of Georgia.

In terms of the continuum of area of impact for hazard events, tornadoes are fairly isolated. Typically ranging from a few hundred to one or two miles across, tornadoes affect far less area than larger meteorological events such as tropical cyclones, winter storms and severe weather events. An exact season does not exist for tornadoes. However, most occur between early spring to mid-summer (February-June). The rate of onset of tornado events is rapid. Typically, the appearance of the first signs of the tornado is the descending funnel cloud. This sign may be only minutes from the peak of the event, giving those in danger minimal sheltering time. However, meteorological warning systems attempt to afford those in danger more time to shelter. The frequency of specific tornado intensities is undetermined because no pattern seems to exist in occurrence. Finally, the duration of tornado events ranges from the few minutes of impact on a certain location to the actual tornado lasting up to a few hours.

Tornadoes are measured after the occurrence using the subjective intensity measures. The Enhanced Fujita Scale describes the damage and then gives estimates of magnitude of peak 3-second gusts in miles per hour.

Natural Hazard: **Tornado**

| EF Number | 3 Second Gust (mph) | Damage |
|-----------|---------------------|--|
| 0 | 65–85 | Light damage. Peels surface off some roofs; some damage to gutters or siding; branches broken off trees; shallow-rooted trees pushed over. |
| 1 | 86–110 | Moderate damage. Roofs severely stripped; mobile homes overturned or badly damaged; loss of exterior doors; windows and other glass broken. |
| 2 | 111–135 | Considerable damage. Roofs torn off well-constructed houses; foundations of frame homes shifted; mobile homes completely destroyed; large trees snapped or uprooted; light-object missiles generated; cars lifted off ground. |
| 3 | 136–165 | Severe damage. Entire stories of well-constructed houses destroyed; severe damage to large buildings such as shopping malls; trains overturned; trees debarked; heavy cars lifted off the ground and thrown; structures with weak foundations blown away some distance. |
| 4 | 166–200 | Devastating damage. Well-constructed houses and whole frame houses completely leveled; cars thrown, and small missiles generated. |
| 5 | More than 200 | Incredible damage. Strong frame houses leveled off foundations and swept away; automobile-sized missiles fly through the air in excess of 100 m (109 yd); high-rise buildings have significant structural deformation; incredible phenomena occur. |

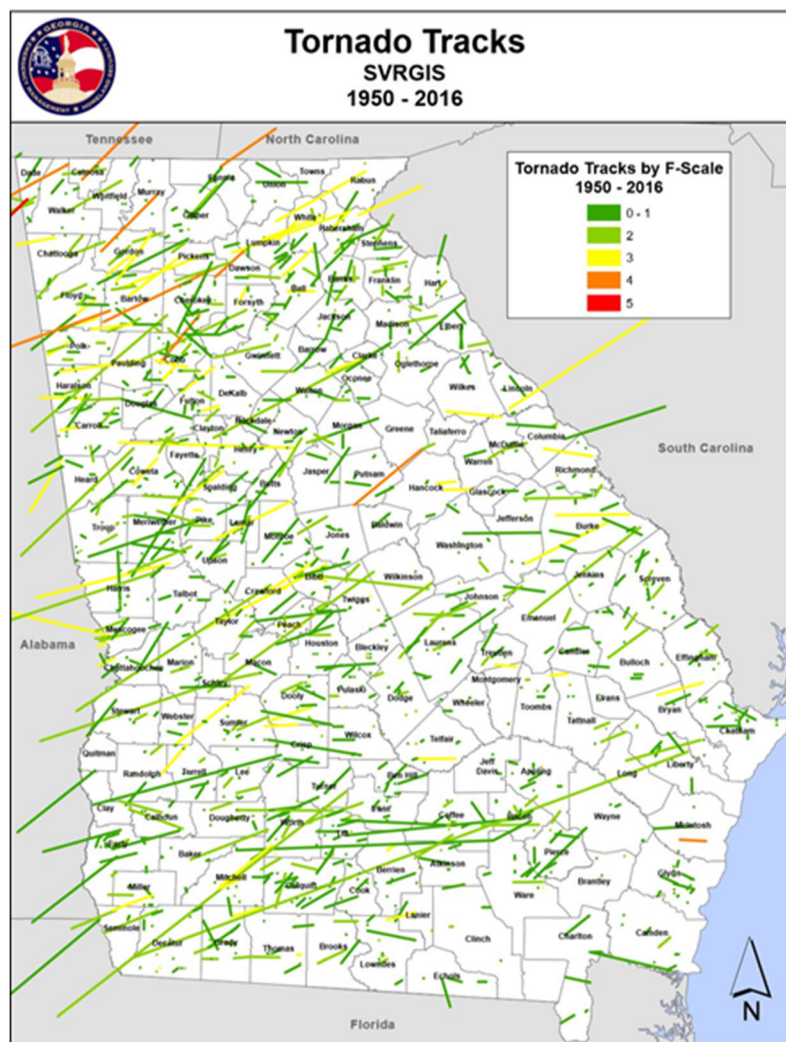

Hazard Profile

All areas within Fayette County are vulnerable to the threat of a tornado. Due to the indiscriminate and unpredictable nature of tornadoes, there is no reliable method to determine where or when a tornado will strike. There have been 7 documented tornadoes in the last 50 years in Fayette County. It is likely that other tornadoes have occurred within this timeframe, but available records are limited in nature.

Based on the 50-year information available for Fayette County, a tornado occurs every 7.1 years. On an annual basis, Fayette County has a 14% chance of being impacted from a tornado event. When only the last twenty years are considered, the likelihood of a tornado affecting Fayette County increases slightly to 20% (4 tornadoes since 1999).

Natural Hazard: Tornado

Individual tornado events can cause extreme damage to an area. This holds true for Fayette County, as well. The strongest documented tornado to impact Fayette County was a F2 in 2006. This storm traveled 3 miles through Fayette County near the City of Tyrone, caused over \$2 million in damages, and damaged approximately 20 homes. The costliest Tornado in the last 50 years occurred in April of 1980. The storm tracked through Harris, Meriwether, Spalding, Fayette, and Clayton Counties. This tornado skipped along from Pine Mountain to near Jonesboro and spent about 50% of its time on the ground. Over \$2.5 million in damages was documented from this storm in Fayette County. For additional historical data, please see Appendix D. All tornado hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction.

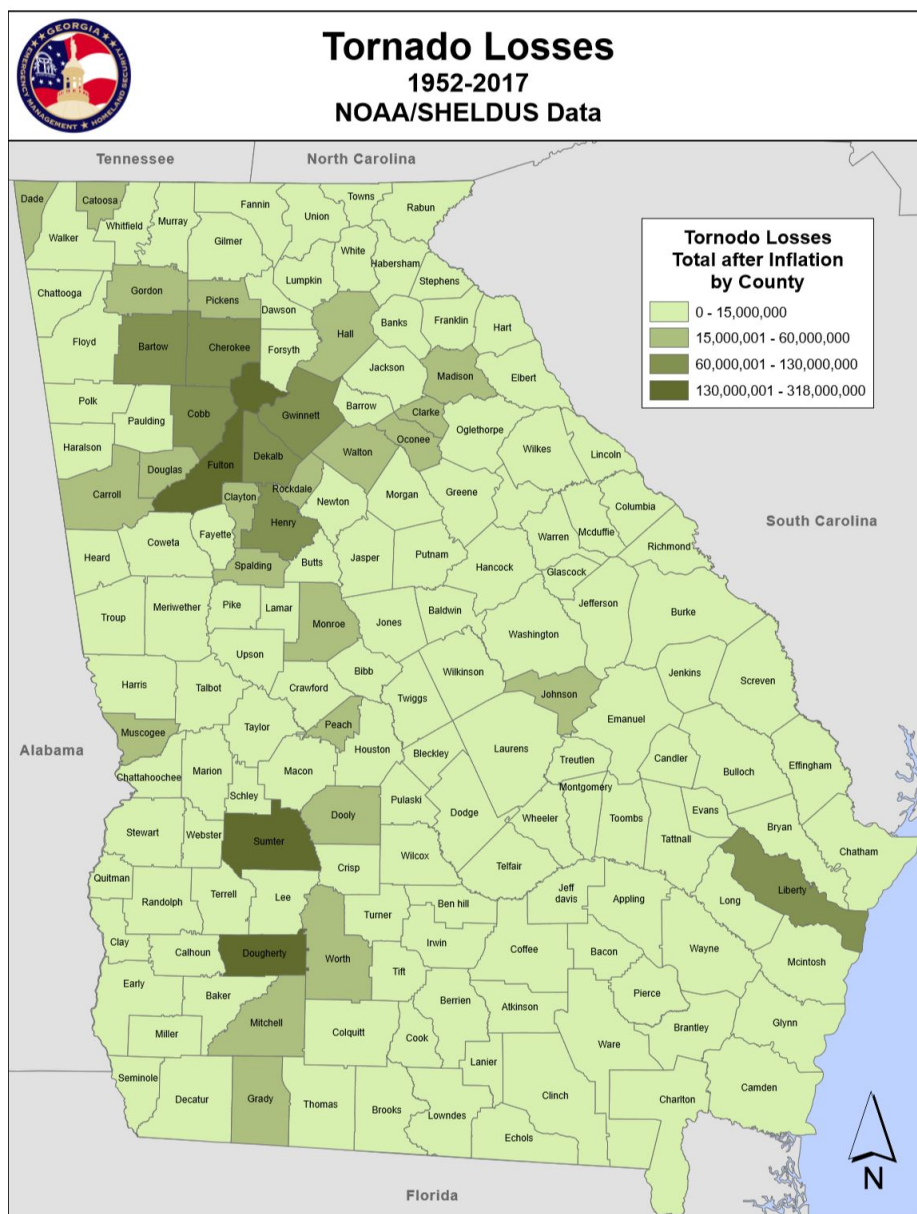

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Tornado

Assets Exposed to the Hazard

In evaluating assets that are susceptible to tornadoes, the Fayette County HMPC determined that all public and private property is threatened by tornadoes, including all critical facilities. This is due to the lack of spatial prejudice of tornadoes.

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Tornado*Estimated Potential Losses*

Estimates of damage for the past events of the last 50 years are over \$6.6 million, or \$132,760 annually. However, singular events can cause a significant impact in the amount of losses. Documented damage estimates for tornado events in Fayette County have varied wildly depending on what was damaged. For example, the 1984 F0 had an estimated damage amount of \$2,500 while the F1 in 1980 had an estimated damage amount of over \$2.5 million.

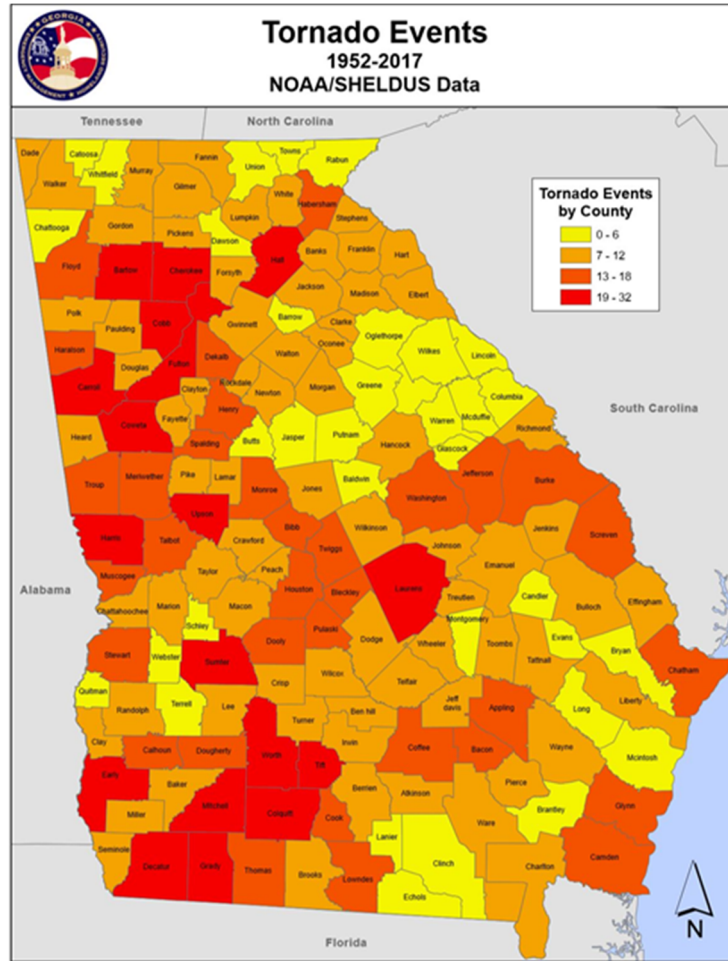

Land Use & Development Trends

Fayette County main land use trend related to Tornadoes involves continued population growth – particularly around the Cities of Fayetteville and Peachtree City. However, the expansion of the Pinewood Studios Complex on Sandy Creek Road, which is a major movie making studio location, has created an additional major potential economic impact from a tornado event. This is particularly pertinent as this area is relatively rural surrounding the Studio except for housing that has been built directly across the road from the Studios which houses personnel directly involved during filming at Pinewood.

*Multi-Jurisdictional Considerations*

All portions of Fayette County could potentially be impacted by a tornado due to the indiscriminate nature of tornadic events. Therefore, all mitigation actions identified regarding tornadoes should be pursued on a countywide basis and included all municipalities.

Natural Hazard: **Tornado**

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Hazard Summary

Fayette County remains at risk to potential damage from tornadoes, especially considering the average of one tornado every 7.1 years over the last 50 years. Should a tornado strike in densely populated areas of the county, significant damage or loss of life could occur. Due to the destructive power of tornadoes, it is essential that the mitigation measures identified in this plan regarding tornado activity receive full consideration.

Natural Hazard: Drought*Hazard Description*

Drought is a normal, recurrent feature of climate consisting of a deficiency of precipitation over an extended period (usually a season or more). This deficiency results in a water shortage for some social or environmental sector. Drought should be judged relative to some long-term average condition of balance between precipitation and evapotranspiration in a particular area that is considered “normal.” Drought should not be viewed as only a natural hazard because the demand people place on water supply affects perceptions of drought conditions. From limited water supplies in urban areas to insufficient water for farmland, the impacts of drought are vast.

Droughts occur in virtually every climatic zone and on every continent. Because the impacts of drought conditions are largely dependent on the human activity in the area, the spatial extent of droughts can span a few counties to an entire country.

Temporal characteristics of droughts are drastically different from other hazards due to the possibility of extremely lengthy durations as well as a sluggish rate of onset. Drought conditions may endure for years or even decades. This factor implicates drought as having a high potential to cause devastation on a given area. The duration characteristic of droughts is so important that droughts are classified in terms of length of impact. Droughts lasting 1 to 3 months are considered short term, while droughts lasting 4 to 6 months are considered intermediate and droughts lasting longer than 6 months are long term. With the slow rate of onset, most populations have some inkling that drought conditions are increasingly present. However, barring drastic response measures, most only have to adapt to the changing environment.

Seasonality has no general impact on droughts in terms of calendar seasons. However, “wet” and “dry” seasons obviously determine the severity of drought conditions. In other words, areas are less susceptible to drought conditions if the area is experiencing a wet season. The frequency of droughts is undetermined, because the hazard spans such a long period of time. However, climatologists track periods of high and low moisture content similarly to the tracking of cooling and warming periods.

Hazard Profile

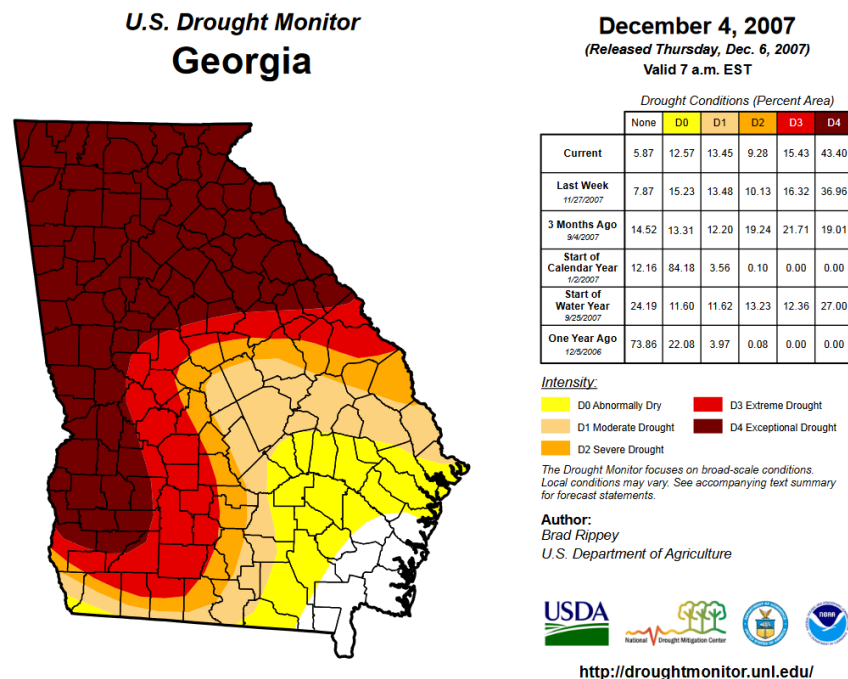

The Fayette County HMPC reviewed data for the last 50 years regarding drought conditions. Historically, agricultural losses have accounted for the vast amount of losses related to drought conditions.

Natural Hazard: Drought

(Hazard Profile Continued)

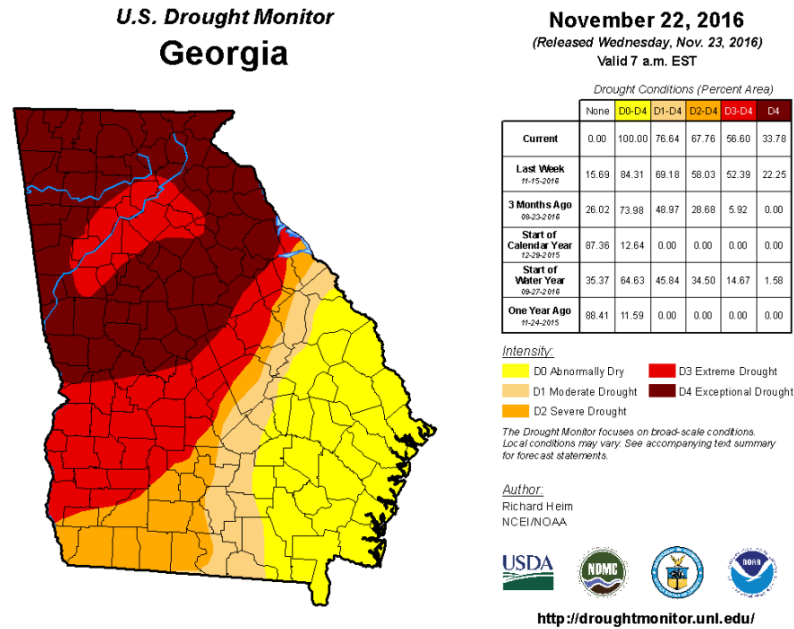

Due to poor record keeping and the unpredictable nature of drought conditions, reliability of historical data for the last 50 years is low. Fayette County has been impacted by 7 drought events in the last 22 years, according to data from the National Climatic Data Center. This amounts to a 32% chance of a drought for a given year over the last 22 years. The economic impact of these droughts, including crop damage, is not available. However, the National Climatic Data Center documents \$2.85 million in crop damage for the 2000 Drought. All drought hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction.

There have been two recent examples of “exceptional” drought events affecting Fayette County. These events occurred in 2007 and 2016. Both events reached the D4 (Exceptional Drought) designation, according to data from the United States Drought Monitor. Below are maps of these two events.

Source: USDA Drought Monitor – University of Nebraska-Lincoln

Natural Hazard: **Drought**

Source: USDA Drought Monitor – University of Nebraska-Lincoln

Events of this extent can cause water shortages for residential and corporate needs, as well as affecting the ability for firefighting operations to be properly effective. Drought conditions of this extent can have devastating effects on the local agricultural industries, which has occurred in previous D4 level droughts.

Assets Exposed to the Hazard

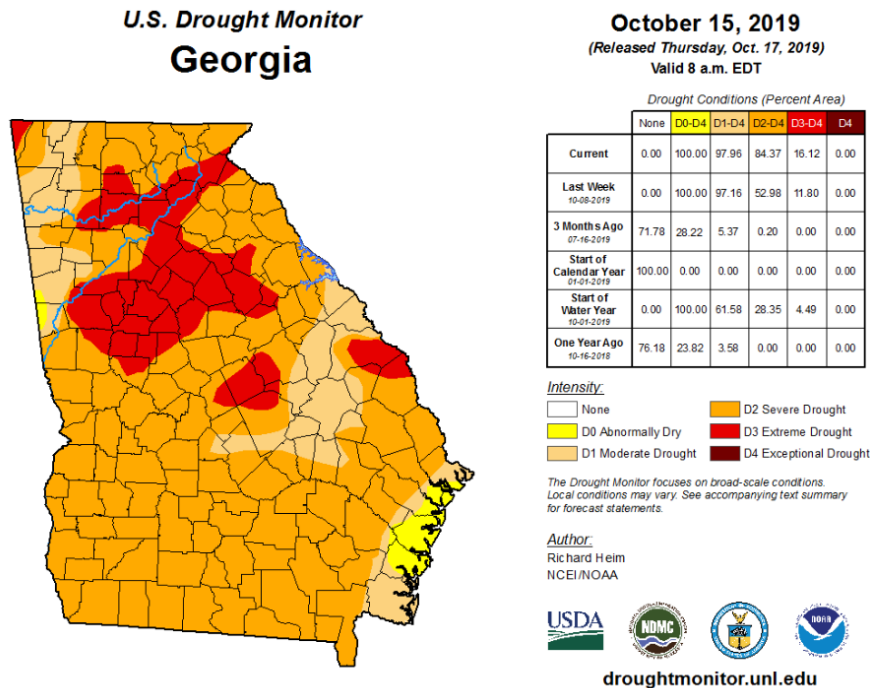

While drought conditions do not typically pose a direct threat to structures, secondary hazards from drought such as increased wildfire threat, does pose a significant threat to all public and private property in Fayette County, including all critical facilities. Water resources could also become scarce during a drought, a condition that would potentially affect all Fayette County residences and critical facilities.

Estimated Potential Losses

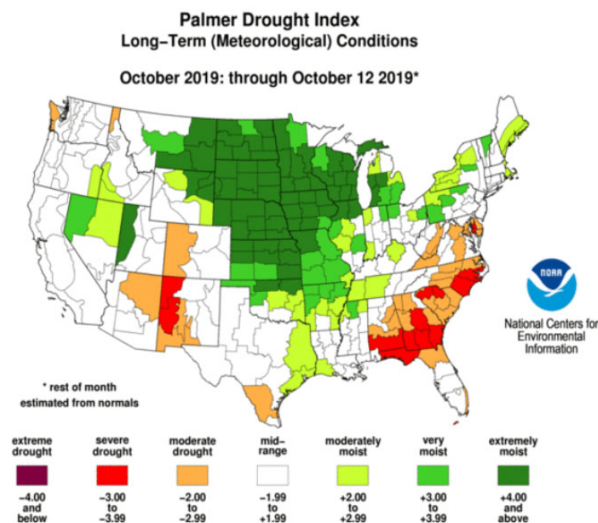

No damage to structures or critical facilities is expected as a direct result of drought conditions. However, crop damage and subsequent losses can be expected to occur because of drought conditions. The degree of losses would depend on the duration of the drought, severity of the drought, temperatures during the drought, season in which the drought occurs, and the specific needs of the involved crops. Water system shortages and need for supply assistance for those systems could also lead to economic losses associated with the drought.

Natural Hazard: Drought

According to the 2017 Agriculture Census data, Fayette County's market value of products sold was \$4,060,000. \$3,207,000 of that total represented crop sales, accounting for 79% of the total. Livestock sales accounted for 21%, or \$853,000, of the total value.

Source: United States Drought Monitor (University of Nebraska-Lincoln)

Source: National Integrated Drought Information System

Natural Hazard: Drought*Land Use & Development Trends*

As growth continues, drought can become a larger threat for Fayette County due to the increased reliance on water infrastructure and wells countywide. This increased pull on these resources in Fayette County could quicken or deepen the impacts of a drought for residential, commercial, and industrial areas.

Multi-Jurisdictional Considerations

All portions of Fayette County could potentially be impacted by a drought, but agricultural areas of the county are potentially more at risk. Therefore, all mitigation actions identified regarding drought should be pursued on a countywide basis and include all municipalities.

Hazard Summary

Drought conditions can cause significant economic stress on the agriculture and forestry interests of Fayette County. The potential negative secondary impacts of drought are numerous. They include increased wildfire threat, decreased water supplies for residential and industrial needs, stream-water quality, and water recreation facilities. The Fayette County HMPC recognizes the potential threats drought conditions could have on the community and have identified specific mitigation actions as a result.

Natural Hazard: Wildfire*Hazard Description*

A wildfire is an uncontained fire that spreads through the environment. Wildfires can consume large areas, including infrastructure, property, and resources. When massive fires, or conflagrations, develop near populated areas, evacuations could possibly ensue. Not only do the flames impact the environment, but the massive volumes of smoke spread by certain atmospheric conditions also impact the health of nearby populations.

Wildfires result from the interaction of three crucial elements: fuel, ignition (heat), and oxygen. Natural and manmade forces cause the three crucial elements to coincide in a manner that produces wildfire events. Typically, fuel consists of natural vegetation. However, as the urban and suburban footprint expands, wildfires may utilize other means of fuel, such as buildings. In terms of ignition or source of heat, the primary source is lightning. However, humans are more responsible for wildfires than lightning. Manmade sources vary from the unintentional, such as fireworks, campfires, or machinery, to intentional arson. With these two elements provided, the wildfires may spread as long as oxygen is present.

Weather is the most variable factor affecting wildfire behavior. Strong winds propel wildfires quickly across most landscapes unless firebreaks are present. Shifting winds create erratic wildfires, which can complicate fire management efforts. Dry conditions provide faster-burning fuels, either making the area more vulnerable to wildfire or increasing the mobility of preexisting wildfires.

Wildfires are notorious for spawning secondary hazards, such as flash flooding and landslides, long after the original fire is extinguished. Both flash flooding and landslides result from fire consuming the natural vegetation that provides precipitation interception and infiltration as well as slope stability.

All of Georgia is prone to wildfire due to the presence of wildland fuels associated with wildfires. Land cover associated with wildland fuels includes coniferous, deciduous, and mixed forest; shrubland; grassland and herbaceous; transitional; and woody and emergent herbaceous wetlands. The spatial extent of wildfire events greatly depends on both the factors driving the fire as well as the efforts of fire management and containment operations.

Natural Hazard: Wildfire*(Hazard Description Continued)*

In terms of seasonality, wildfires can occur during any season of the year. However, drier seasons, which vary within the State of Georgia, are more vulnerable to severe wildfires because of weather patterns and the abundant quick-burning fuels. In terms of rate of onset and duration, wildfires vary depending on the available fuels and weather patterns. Some wildfires can engulf an area in a matter of minutes from the first signs whereas others may be slower burning and moving. The frequency of wildfires is not typically measured because of the high probability of human ignition being statistically unpredictable. Magnitude and intensity are typically only measured by size of the wildfire and locations of burning.

Three classes of fires include understory, crown, and ground fires. Naturally induced wildfires burn at relatively low intensities, consuming grasses, woody shrubs, and dead trees. These understory fires often play an important role in plant reproduction and wildlife habitat renewal and self-extinguish due to low fuel loads or precipitation. Crown fires, which consist of fires consuming entire living trees, are low probability but high consequence events due to the creation of embers that can be spread by the wind. Crown fires typically match perceptions of wildfires. In areas with high concentrations of organic materials in the soil, ground fires may burn, sometimes persisting undetected for long periods until the surface is ignited.

Hazard Profile

Wildfires pose a serious threat to Fayette County. This is a result of the high amount of forestland and vegetation available to fuel potential wildfires. Also, there is an increasing amount of wildland-urban interface (WUI) in Fayette County, which is defined as areas where structures and other human development meets undeveloped wildland properties. 98.9% of Fayette County's population lives within the WUI. All wildfire hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction.

Wildfire statistics were not available for the 50-year timeframe at the time of this profile. According to the Fayette County office of the Georgia Forestry Commission, Fayette County had 26 wildfires from 2009 to 2019 that consumed a total of 131 acres. This equates to an average of 2.6 wildfires per year and these fires consume an average of 13.1 acres per year. Fayette County has a 0.7% daily chance of a wildfire.

Natural Hazard: **Wildfire**

Georgia Wildfire Ignition Density

Source: Southern Group of State Foresters Wildfire Risk Assessment Portal

Assets Exposed to the Hazard

All public and private property located within the Wildland-Urban Interface, including critical infrastructures, are susceptible to impacts from wildfires. Due to the large area of wildland area in Fayette County and the large amount of WIU, all public and private property, including critical infrastructures, could be directly or indirectly impacted by the threat of wildfire.

| Jurisdiction | Percentage of Population in WUI |
|----------------|---------------------------------|
| Fayette County | 98.9% |
| Brooks | 99.4% |
| Fayetteville | 98.6% |
| Peachtree City | 98.5% |
| Tyrone | 99.1% |
| Woolsey | 100% |

Natural Hazard: Wildfire*Estimated Potential Losses*

Little information is available regarding damages, in terms of dollars, for wildfire losses in Fayette County. According to the 2017 Ag Census by the USDA, Fayette County has just over \$4 million in annual crop sales. These areas would potentially be impacted by a wildfire event.

Land Use & Development Trends

With the continued increase in population, Wildland-Urban Interface (WUI) is increasing in Fayette County. The WUI creates areas where fire can easily move from wildland areas into developed areas and threaten structures and human life. The expansion of the WUI in Fayette County complicated wildland fire management operations and planning initiatives. This development trend is expected to continue in the future. Additionally, recent land use trends around the Pinewood Studios Complex on Sandy Creek Road increases the likelihood of direct economic impacts from a wildfire in this area. The Pinewood Studios Complex, according to SouthWRAP, the complex is at a moderate risk on the Fire Intensity Scale and rates high (7 or 8 on a scale 1 to 9) on Wildland-Urban Interface Risk.

Multi-Jurisdictional Considerations

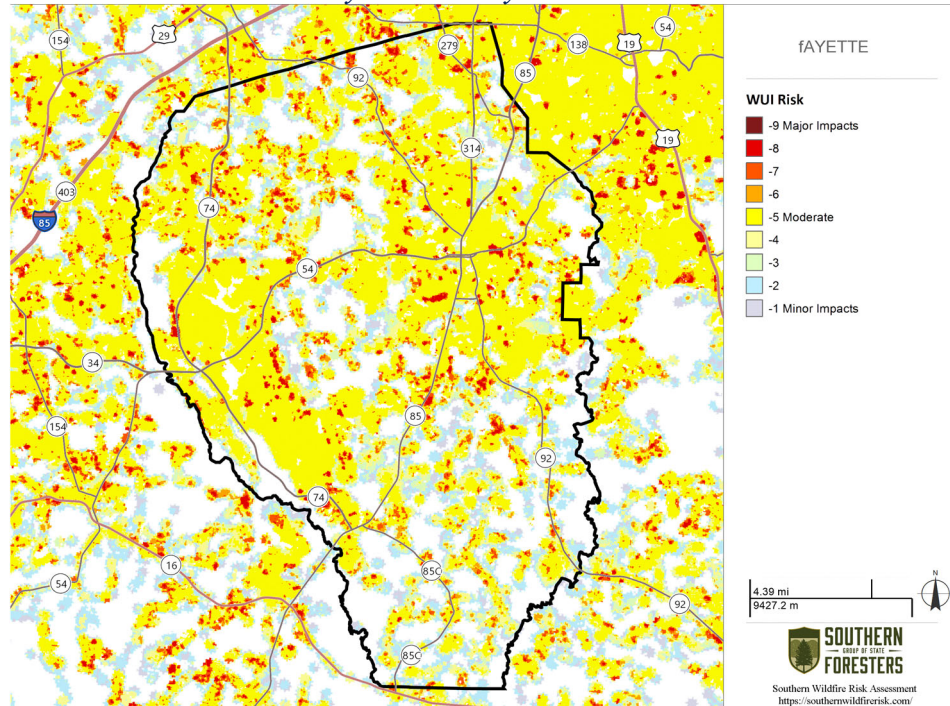

All portions of Fayette County, including all municipalities, could potentially be impacted by a wildfire due to the large amount of Wildland-Urban Interface, but the less developed areas of the county are more vulnerable. Therefore, all mitigation actions identified regarding wildfires should be pursued on a countywide basis and include all municipalities.

Hazard Summary

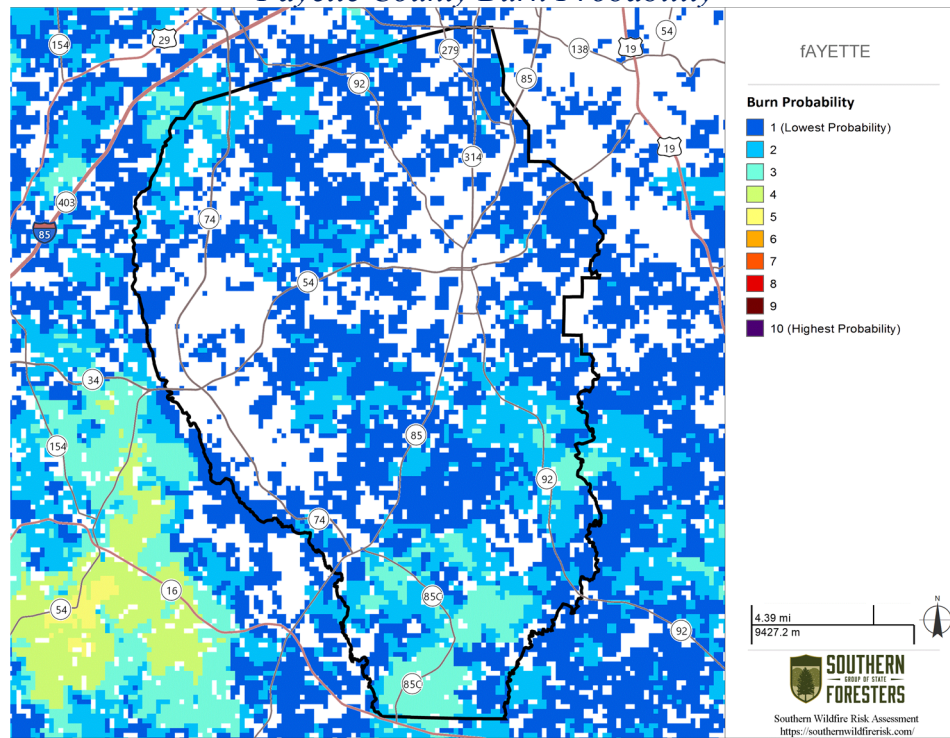

Wildfire is a significant threat to Fayette County due to the increased amount of Wildland-Urban Interface. The increasing amount of area where structures and other human development meets undeveloped, wildland property is where 98.9% of Fayette County's population lives. The mitigation measures identified in this plan should be aggressively pursued based on the high frequency of this hazard and the ability for wildfires to inflict devastation anywhere in Fayette County.

Natural Hazard: Earthquakes*Hazard Description*

Earthquakes are generally defined as the sudden motion or trembling of the Earth's surface caused by an abrupt release of slowly accumulated strain. This release typically manifests on the surface as ground shaking, surface faulting, tectonic uplifting and subsidence, or ground failures, and tsunamis. In the United States, earthquake activity east of the Rocky Mountains is relatively low compared to the Western states because it is away from active plate boundaries and the plate interior strain rates are known to be very low.

The physical property of earthquakes that causes most of the damage within the United States is ground shaking. The vibrations from the seismic waves that propagate outward from the epicenter may cause failure in structures not adequately designed to withstand earthquakes. Because the seismic waves have different frequencies of vibration, the waves disseminate differently through sub-surface materials. For example, high frequency compression and shear waves arrive first, whereas lower frequency Rayleigh and love waves arrive later. Not only are the speeds varied between seismic waves, but also the types of movement. The surface vibration may be horizontal, vertical, or a combination of the two, which causes a wider array of structures to collapse.

Another manifestation of earthquakes is surface faulting. This phenomenon is defined as the offset or tearing of the earth's surface by a differential movement across a fault. Structures built across active faults tend to sustain damage regularly. There are no active faults within or near Georgia. Distinct inactive faults are known within the state north of the Columbus to Macon to Augusta fall line and running generally northeast-southwest.

The third earthquake phenomenon that causes damage is tectonic uplift and subsidence. Tectonic uplift can cause shallowing of the harbors and waterways while tectonic subsidence can cause permanent or intermittent inundation. Due to the association of tectonic uplift and subsidence with active faults, Georgia is not at risk to these phenomena.

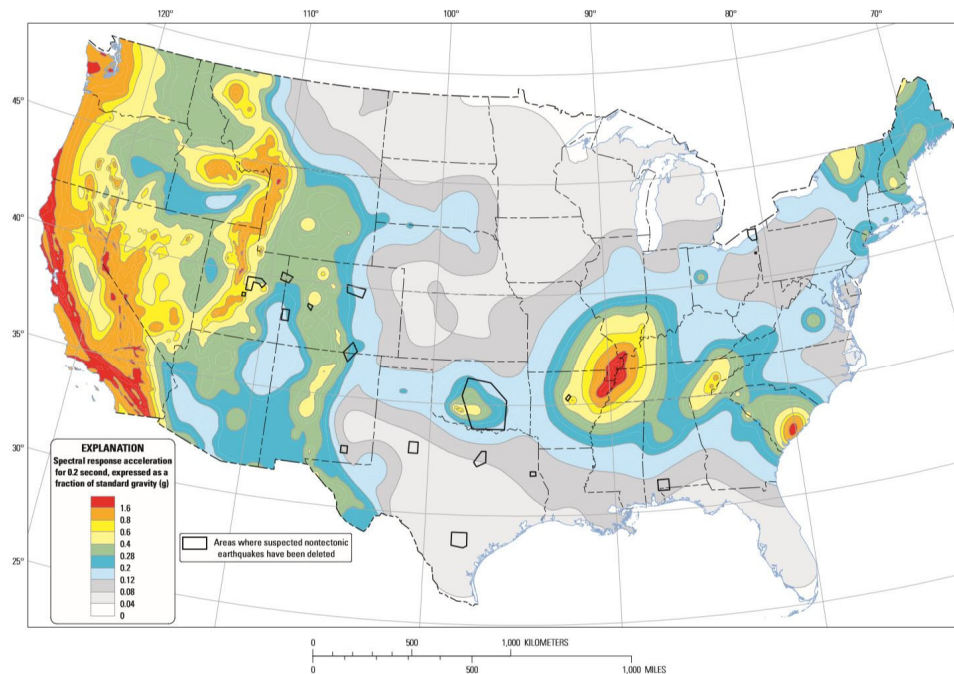

The fourth earthquake damage-causing phenomena are earthquake-induced ground failures, including liquefaction and landslides. During an earthquake, the areas that are rich in sand and silt have groundwater within 30 feet of the surface temporarily behave as viscous fluids during strong ground shaking. Structures built on these materials can settle, topple, or collapse as the ground "liquefies" beneath it. Landslides can also form when earthquake shaking or seismic activity dislodges rock and debris on steep slopes, triggering rock falls, avalanches, and slides.

Natural Hazard: Earthquakes*(Hazard Description Continued)*

Also, unstable, or nearly unstable, slopes consisting of clay soils may lose shear strength when disturbed by ground shaking and fail, resulting in a landslide. Georgia is at very low risk of seismic induced liquefaction or landslides.

The last of the earthquake-induced phenomena are tsunamis, which are large, gravity-driven waves triggered by the sudden displacement of a large volume of water. The waves produced travel in all directions from the origin at speeds of up to 600 miles per hour. In deep water, tsunamis normally have small wave heights. However, as the waves reach shallower water near land, the wave speed diminishes, and the amplitude drastically increases. Upon impact with a shoreline, the waves can inundate land rapidly, engulfing everything in its path. Successive wave crests follow, typically arriving minutes to hours later, frequently with later arrivals being more dominant. Frequently, the first tsunami waves are downward, causing dramatic exposure of the beach. Because of this, people are often killed trying to collect newly exposed seashells when the positive waves then arrive.

Although large tsunamis are rare in the eastern coast of the US, the possibility of such events occurring anywhere along the Atlantic and Gulf coast exists.

Two-percent probability of exceedance in 50 years map of 0.2 second spectral response acceleration

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: **Earthquakes**

Hazard Profile

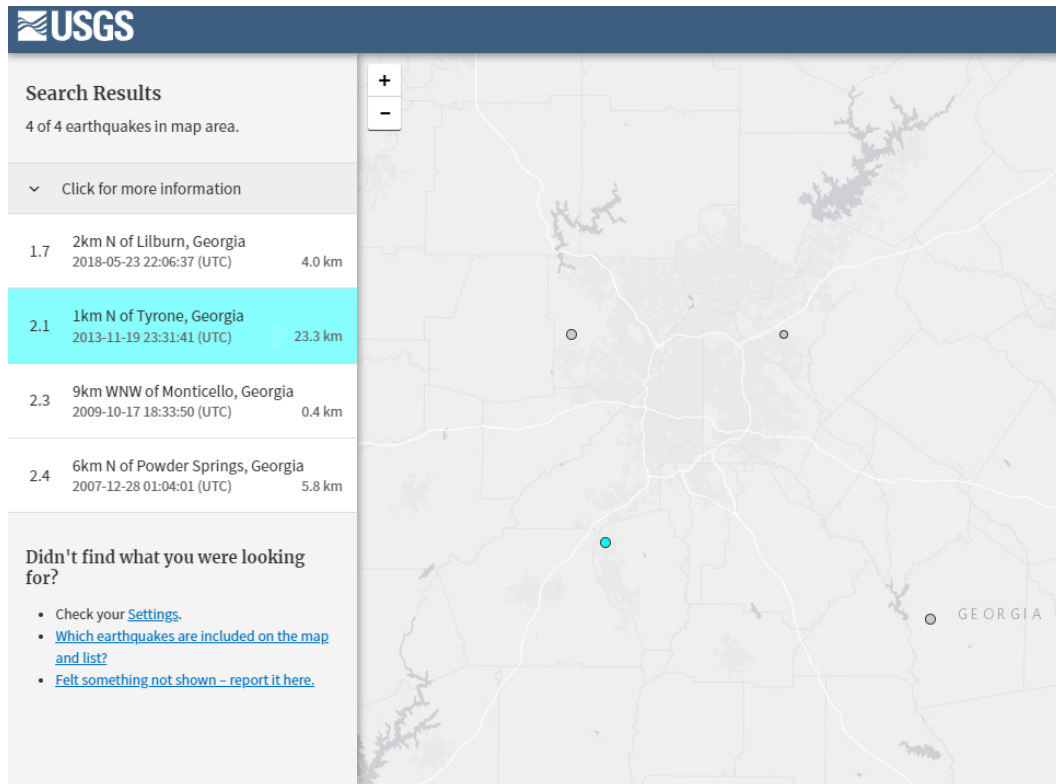

Fayette County is not one of the 37 Georgia counties with the highest earthquake risk, according to GEMA and Georgia Tech School of Earth and Atmospheric Sciences. In reviewing data of the last 50 years, one earthquake originated from within Fayette County. This earthquake occurred on November 19, 2013 1 km North of Tyrone and registered 2.1 on the Richter Scale. Only 4 earthquakes have originated within 50 miles of Fayetteville, GA in the last 50 years. Eight of those earthquakes occurred near Lake Sinclair on the Putnam-Baldwin County line. The strongest earthquake to occur within the 50-mile radius was a 3.5 that occurred in Wilkes County in 2003. Fayette County has an 8% chance of an earthquake occurring within 50 miles of Fayetteville, GA in any given year. Historically, the 1886 Charleston, SC earthquake, estimated to be between 6.6 and 7.3 on the modern Richter Scale, likely caused impacts to Fayette County. Although no historical records exist exhibiting any damages, Fayette County was estimated to be in a level VI area of the Modified Mercalli Intensity scale for this event. This would indicate strong shaking felt by everyone inside and outside at the time of the event and characterized by broken windows, movement of heavy furniture, and slight to moderate damage for poorly built buildings. Even with this low number of occurrences, it was determined that if earthquakes occur within or close to the jurisdiction of Fayette County, significant damage could occur. Therefore, the Fayette County HMPC has determined the threat of earthquakes to be higher than the statistics would indicate. All earthquake hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction.

| Instrumental Intensity | Acceleration (%g) | Velocity (cm/s) | Perceived Shaking | Potential Damage |
|------------------------|-------------------|-----------------|-------------------|-------------------|
| I | < 0.17 | < 0.1 | Not Felt | None |
| II-III | 0.17 - 1.4 | 0.1 - 1.1 | Weak | None |
| IV | 1.4 - 3.9 | 1.1 - 3.4 | Light | None |
| V | 3.9 - 9.2 | 3.4 - 8.1 | Moderate | Very light |
| VI | 9.2 - 18 | 8.1 - 16 | Strong | Light |
| VII | 18 - 34 | 16 - 31 | Very Strong | Moderate |
| VIII | 34 - 65 | 31 - 60 | Severe | Moderate to Heavy |
| IX | 65 - 124 | 60 - 116 | Violent | Heavy |
| X+ | > 124 | > 116 | Extreme | Very Heavy |

Natural Hazard: Earthquakes

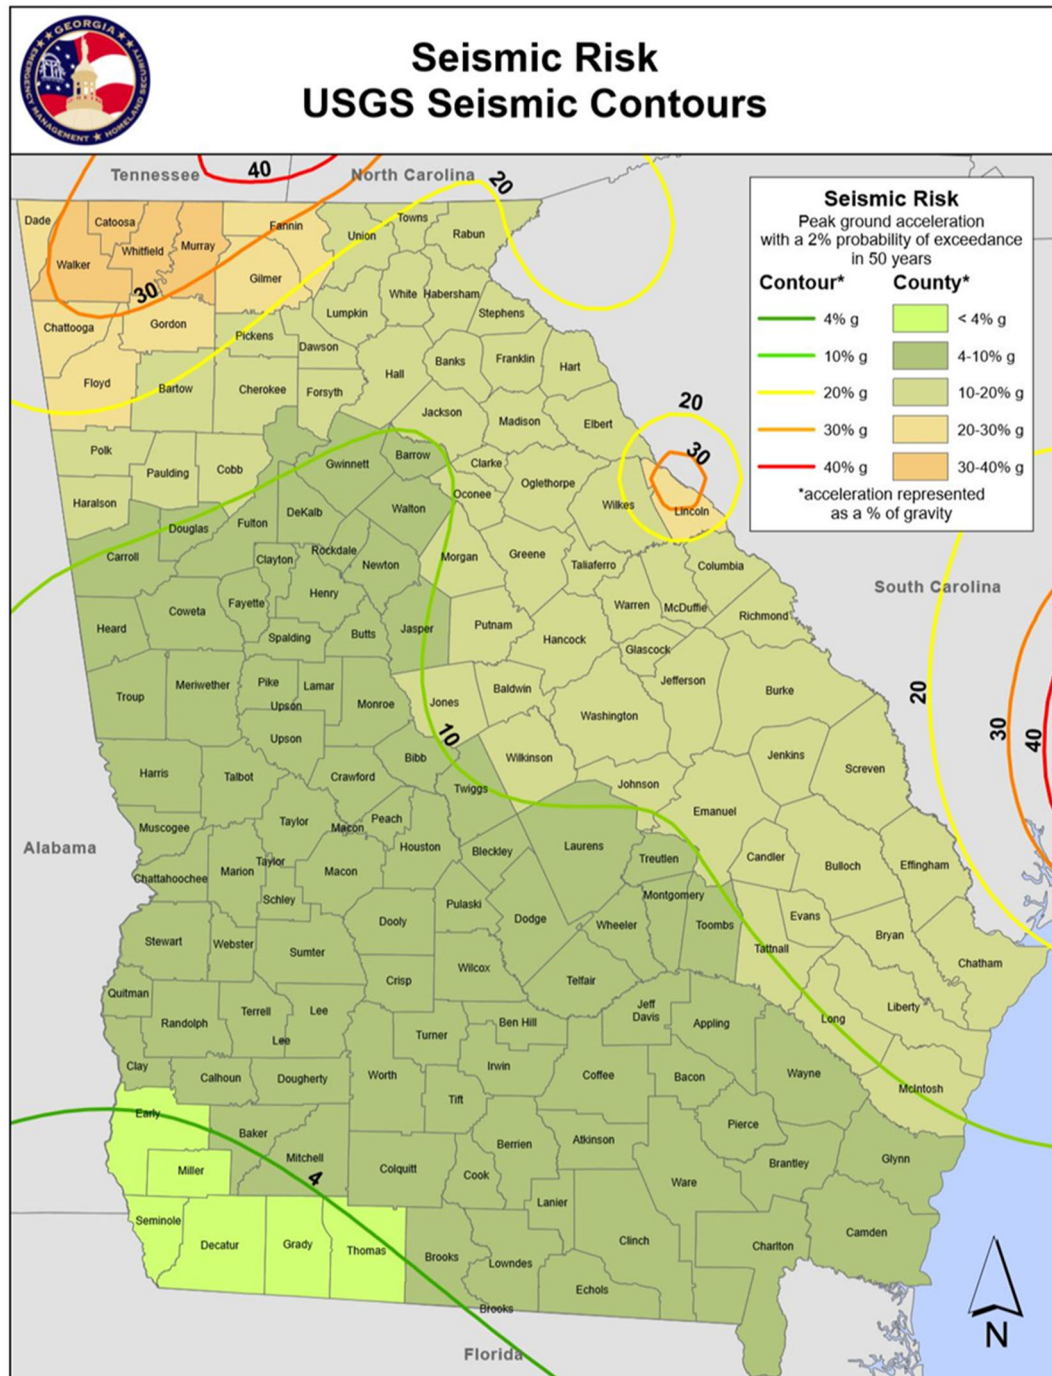

Assets Exposed to the Hazard

The Fayette County HMPC determined that all critical facilities and all public and private property within Fayette County are susceptible to the impacts of an earthquake due to the lower building codes with regards to earthquakes when compared to other parts of the country. This includes all municipalities.

Source: United States Geological Survey (USGS) Earthquake Hazards Program

Natural Hazard: Earthquakes

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Earthquakes*Estimated Potential Losses*

Little information is available regarding damages, in terms of dollars, for earthquake losses in Fayette County.

Land Use and Development Trends

Fayette County currently has no land use trends related to Earthquakes.

Multi-Jurisdictional Considerations

All of Fayette County, including all municipalities, potentially could be threatened by earthquakes. As such, all earthquake mitigation actions should be pursued on a countywide basis and include all municipalities.

Hazard Summary

Even with the infrequency of earthquake impacts in Fayette County, the potential losses and impacts associated with the event would severely damage the infrastructure and economic viability of the County and all municipalities. The mitigation measures identified in this plan should be pursued based on the high impact potential of this hazard and the ability for earthquakes to inflict widespread devastation anywhere in Fayette County.

Natural Hazard: Tropical Cyclone

Hazard Description

The National Weather Service describes tropical cyclones systems in the Atlantic Basin, including the Gulf of Mexico and Caribbean Sea, into four types based on strength.

Tropical Disturbance: A discrete tropical weather system of apparently organized thunderstorms – generally 100 to 300 nautical miles in diameter – originating in the tropics or subtropics, and maintaining its identity for 24 hours or more.

Tropical Depression: An organized system of clouds and thunderstorms with a defined circulation and maximum sustained winds of 38 mph (33 knots) or less.

Tropical Storm: An organized system of strong thunderstorms with a defined circulation and maximum sustained winds of 39 mph to 73 mph (34-63 knots).

Hurricane: An intense tropical weather system with a well-defined circulation, producing maximum sustained winds of 74 mph (64 knots) or greater. Hurricane intensity is classified into five categories using the Saffir-Simpson Hurricane scale. Winds in a hurricane range from 74-95 mph for a Category 1 hurricane to greater than 156 mph for a Category 5 hurricane.

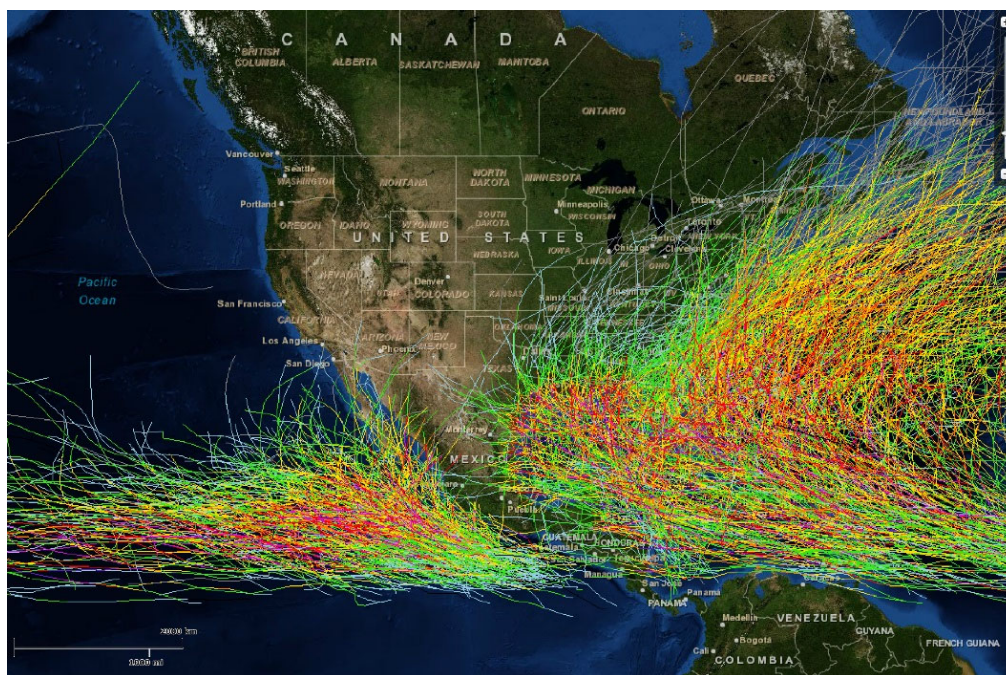

| Saffir-Simpson Scale for Hurricane Classification | | | | |
|---|------------------|------------------|----------------------|-----------------|
| Strength | Wind Speed (Kts) | Wind Speed (MPH) | Pressure (Millibars) | Pressure |
| Category 1 | 64- 82 kts | 74- 95 mph | >980 mb | 28.94 "Hg |
| Category 2 | 83- 95 kts | 96-110 mph | 965-979 mb | 28.50-28.91 "Hg |
| Category 3 | 96-113 kts | 111-130 mph | 945-964 mb | 27.91-28.47 "Hg |
| Category 4 | 114-135 kts | 131-155 mph | 920-944 mb | 27.17-27.88 "Hg |
| Category 5 | >135 kts | >155 mph | 919 mb | 27.16 "Hg |
| Tropical Cyclone Classification | | | | |
| Tropical Depression | | 20-34kts | | |
| Tropical Storm | | 35-63kts | | |
| Hurricane | | 64+kts or 74+mph | | |

Natural Hazard: Tropical Cyclone*(Hazard Description Continued)*

Tropical cyclones can cause catastrophic damage to coastlines and areas several hundred miles inland. Tropical cyclones can produce sustained high winds and spawn tornadoes and microbursts. Additionally, tropical cyclones can create storm surges along the coast and cause extensive damage from heavy rainfall. Floods and flying debris from the excessive winds are often the deadly and destructive results of these weather events.

Slow moving tropical cyclones traveling into mountainous regions tend to produce especially heavy rain. Excessive rain can trigger landslides or mudslides. Flash flooding can also occur due to intense rainfall.

Each of these hazards present unique characteristics and challenges; therefore, the following have been separated and analyzed as individual hazards: Tropical cyclones, Thunderstorms, Tornadoes, and Flooding. This section will focus on the direct effects of tropical cyclones.

*Hazard Profile*

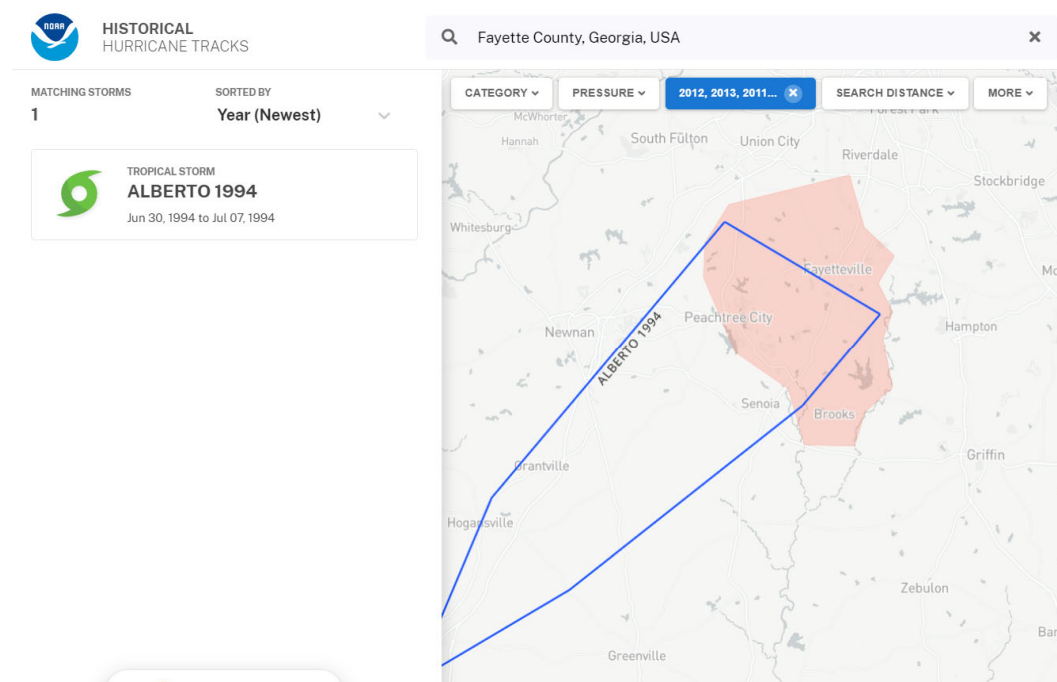

Tropical cyclones have directly impacted Fayette County on an infrequent basis over the last 50 years. However, the possibility of a hurricane or tropical storm retaining their wind strength as far inland as Fayette County is possible. There

Natural Hazard: Tropical Cyclone*(Hazard Profile Continued)*

have been 15 documented impacts from Tropical Cyclones in Fayette County. This equates to a 30% chance of a tropical cyclone impacting Fayette County in any given year. The Fayette County Hazard Mitigation Update Committee believes this percentage is more representative of the potential impact.

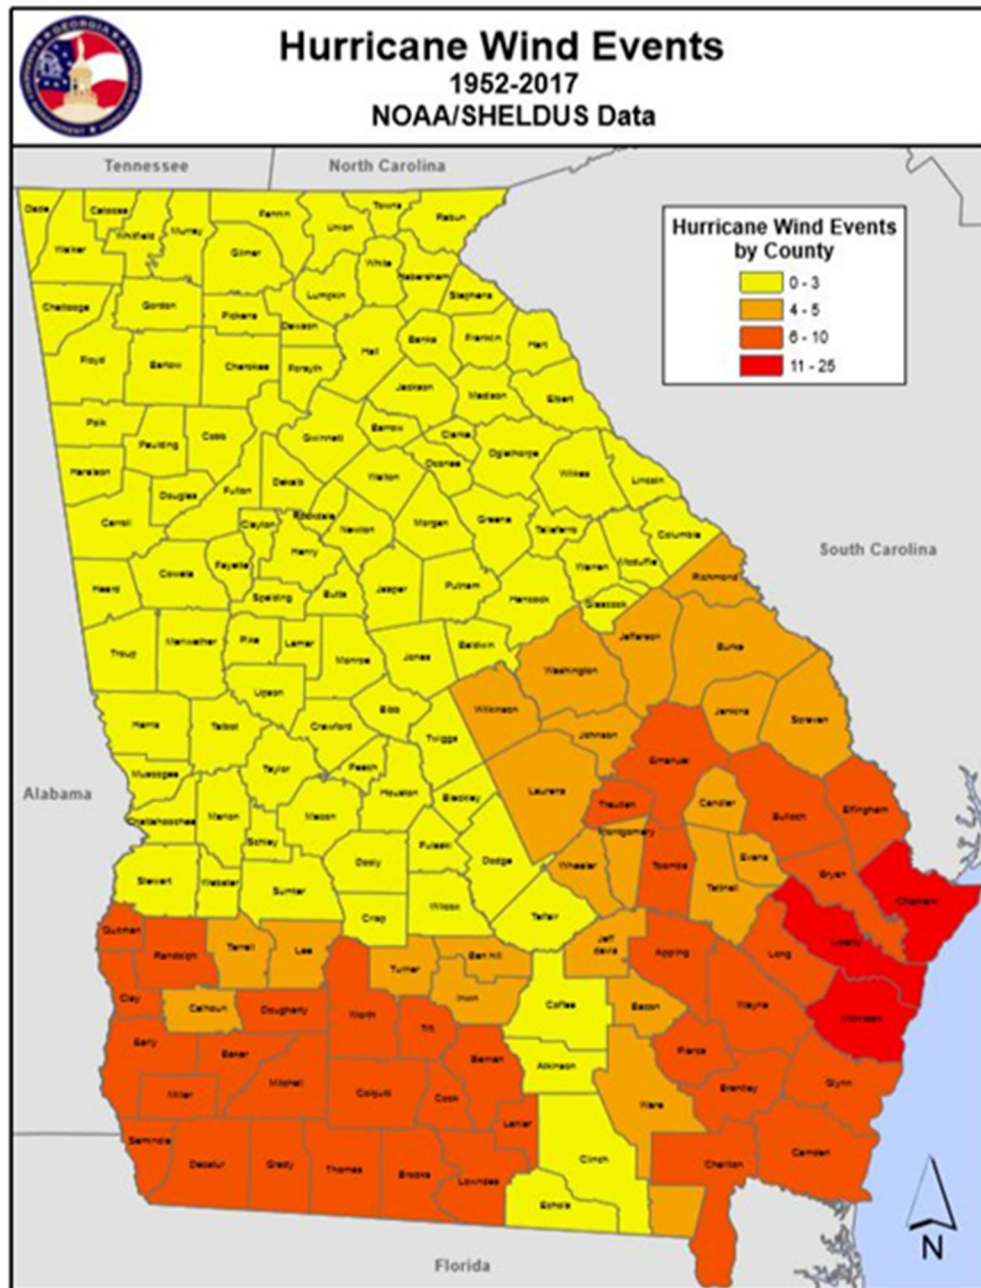

Only one tropical cyclone – Tropical Storm Alberto in 1994 – has had a track that directly dissected Fayette County in the last 50 years. All tropical cyclone hazard data included for Fayette County is limited to countywide data and is not broken down by jurisdiction. In 2017, Hurricane Irma dropped 4-5 inches of rain on Fayette County and wind gusts up to 50 mph (tropical storm-strength) were reported in the county.

Even with the infrequent occurrences, the impacts that would result from hurricane or tropical storm forces on the citizens, infrastructure, and critical facilities of Fayette County could be potentially catastrophic in nature.

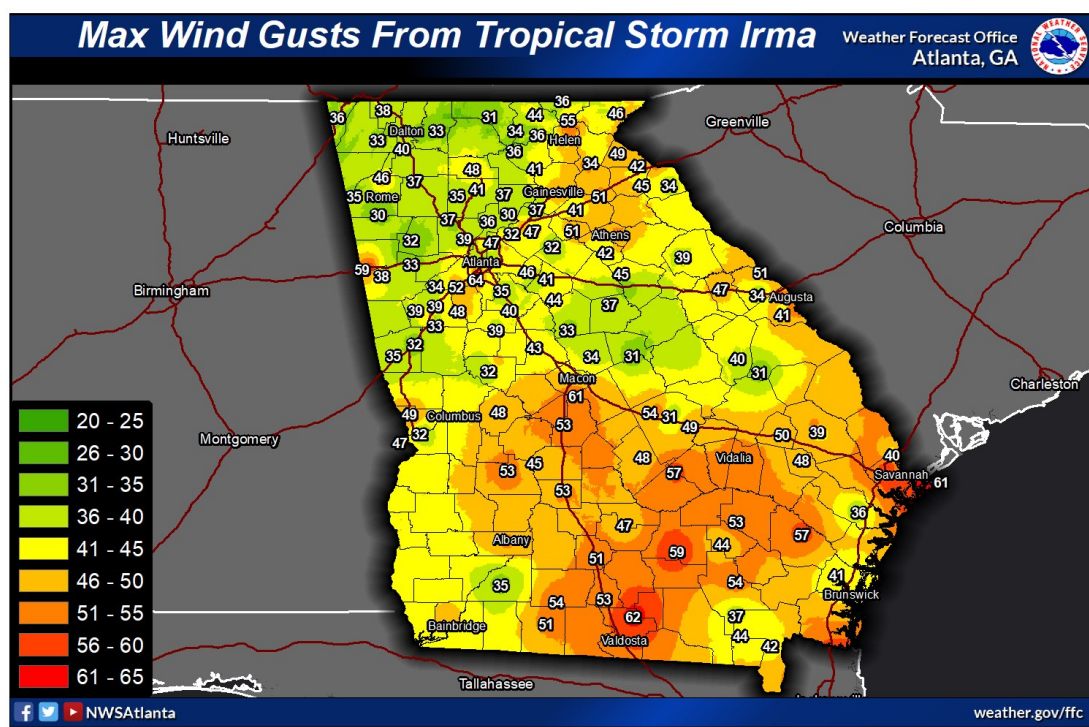

Source: Office of Coastal Management (NOAA)

Natural Hazard: Tropical Cyclone

Source: 2019-2024 Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Tropical Cyclone*Assets Exposed to the Hazard*

The Fayette County HMPC determined that all critical facilities and all public and private property within Fayette County are susceptible to the direct and indirect impacts of a tropical cyclone. This includes all municipalities.

Estimated Potential Losses

Little information is available regarding damages, in terms of dollars, is available for tropical cyclone losses in Fayette County. Most losses for these events have been labeled under other impacts, such as tornadoes and flooding.

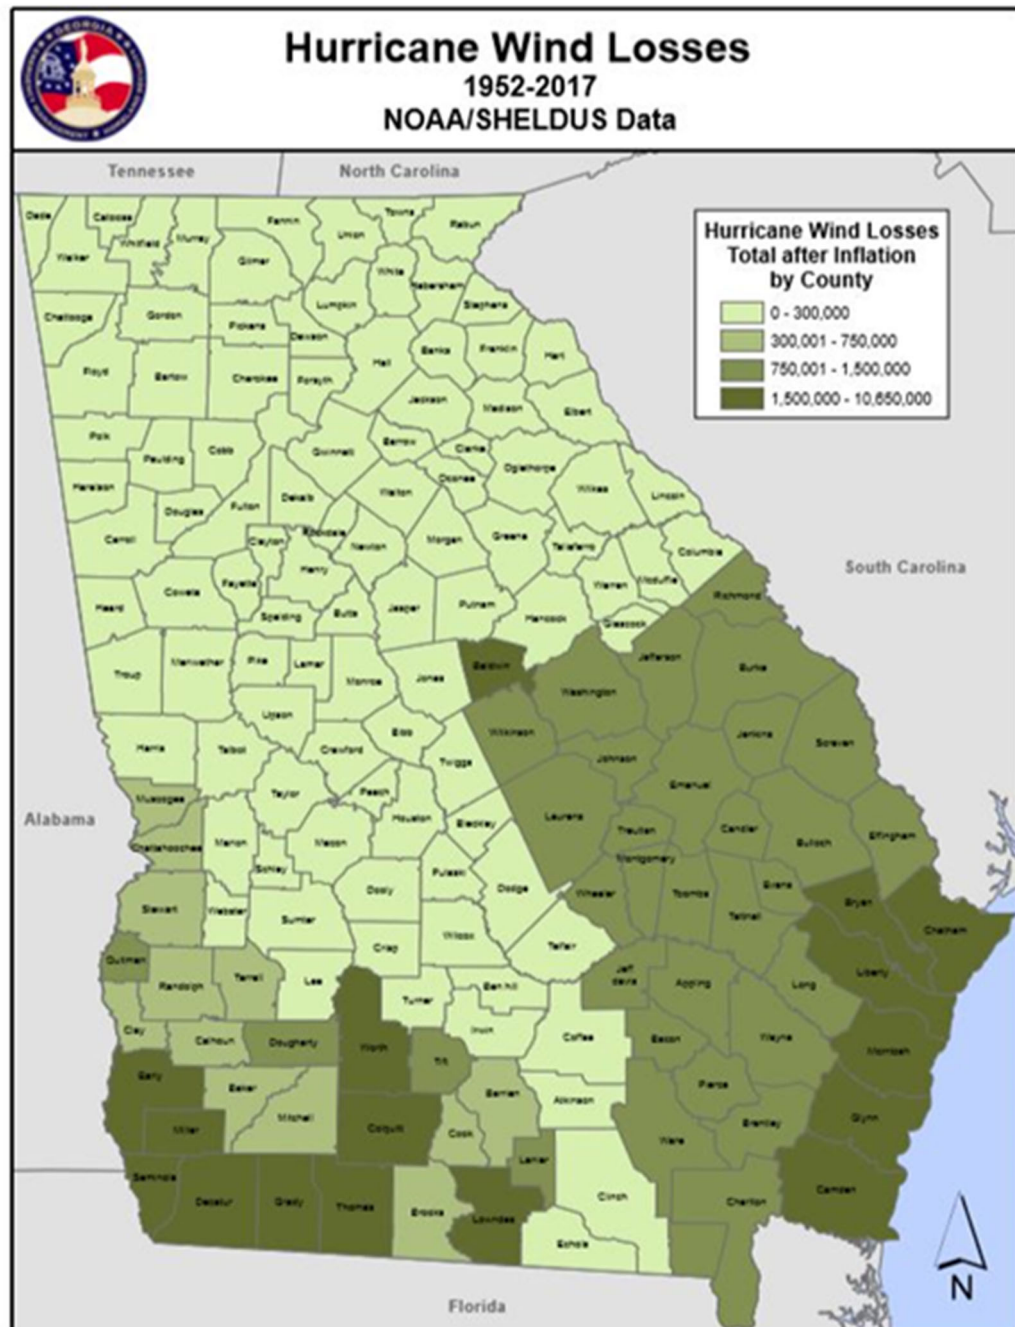

Land Use and Development Trends

Fayette County currently has no land use trends related to Tropical Cyclones.

Multi-Jurisdictional Considerations

All of Fayette County, including all municipalities, could potentially be threatened by tropical cyclones. As such, all tropical cyclone mitigation actions should be pursued on a countywide basis and include all municipalities.

Natural Hazard: Tropical Cyclone

Source: 2019-2024 Georgia Hazard Mitigation Strategy and Enhanced Plan

Natural Hazard: Extreme Temperatures

Extreme temperatures – both hot and cold – can pose a significant threat to an underprepared population. This is particularly true in areas where a population has a large elderly population, a large population of small children, and a population with lower socioeconomic status.

The term extreme heat can be subjective to a degree. FEMA, in their “Mitigation Ideas” publication defines extreme heat as “the condition where temperatures consistently stay ten degrees or more above a region’s average high temperature for an extended period.” The key to this definition is, extreme heat is relative to the average temperature, regardless of the time of year. For example, the National Center for Environmental Information (NCEI) records heat events in Georgia with 60- and 70-degree temperatures in December and January, simply because they are significantly higher than the average temperature for that time of year. According to www.ready.gov/heat, FEMA also offers another definition of extreme heat: “In most of the United States, extreme heat is defined as a long period (2 to 3 days) of high heat and humidity with temperatures above 90 degrees.” This definition can also lead to some subjectivity in the term “extreme.” For example, people that live in the southern parts of the country are more adapted to temperatures in the 90s and 100s than people that live in the more northern tiers. This is not to say those temperatures are not still dangerous. Notably, in recent years, more heat related deaths have occurred in the southern tier states than the northern tiers. The National Weather Service, however, focuses on “Excessive Heat,” defining it as heat indices of 105 degrees or more using a combination of temperature and humidity as a “real feel.”

Just as extreme heat can be subjective, so can extreme cold. Just as the National Weather Service utilizes heat index to attempt to quantify extreme heat, wind chill is often utilized to quantify extreme cold. Prolonged and/or unprotected exposure to extreme cold can be detrimental to people and animals. Additionally, it can be detrimental to exposed infrastructure, as well.

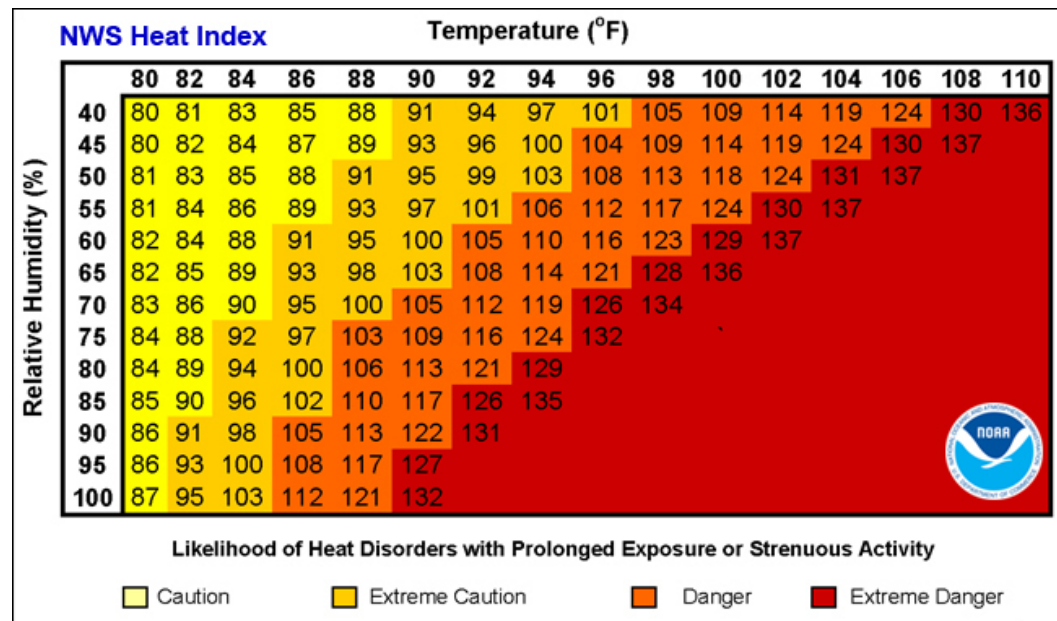

Hazard Profile

According to the National Climatic Data Center, Fayette County have been exposed to extreme cold/wind chill and excessive heat events on 21 occasions since 1999. This means that Fayette County has averaged one extreme temperature event every year 1999. This included 10 extreme cold events and 11 excessive heat events. This averages out to an extreme cold event every 1.9 years (52.6% annual chance) and an excessive heat event every 1.73 years (57.9% annual chance).

Natural Hazard: Extreme Temperatures

In August of 2007, Atlanta had 8 days that cleared 100 degrees and set eight maximum temperature records during the month. On August 22nd, temperatures reached 104 degrees, which set a new record for the month of August. The temperature on August 10th was recorded at 105 degrees. The all-time high for Atlanta was set on June 30, 2012 as temperatures reached 106 degrees.

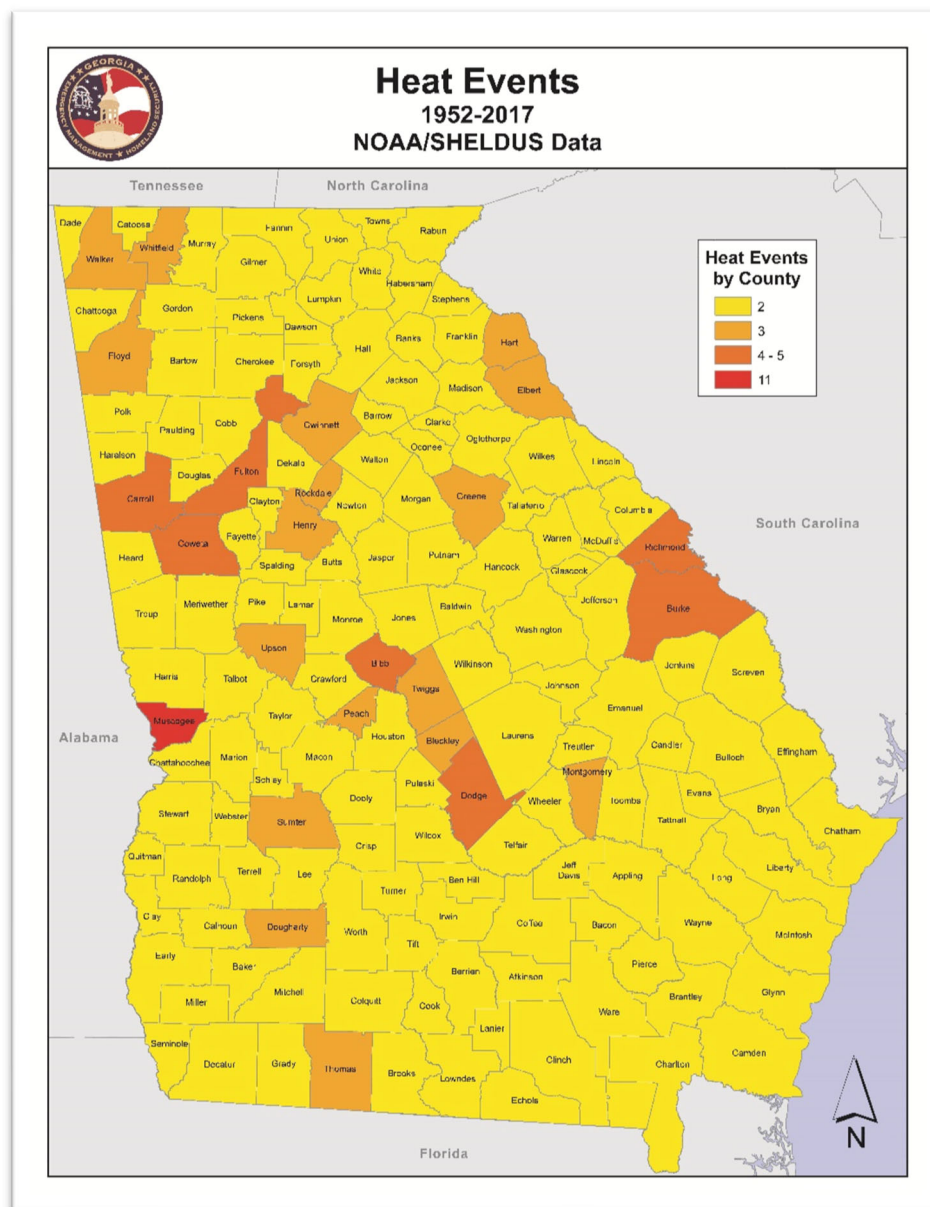

Due to the large elderly (16.1% of total population above the age of 65), Fayette County's population is particularly susceptible to heat-related illnesses.

Source: 2019-2024 Georgia Hazard Mitigation Strategy and Enhanced Plan

Fayette County has also been exposed to many extreme cold events. Due to its lower latitude and position within Georgia, Fayette County can avoid much of the extreme cold temperatures that sometimes plague the mountainous regions of northeast Georgia. However, Fayette's location and lack of widespread exposure to such events increases the impact those events could have if they were to occur. In 2014, an arctic front sent temperatures into the single digits across north Georgia, including Fayette County. This event was accompanied by high winds, which pushed wind chills to -10 degrees in the early morning hours.

Natural Hazard: Extreme Temperatures

Source: 2019-2024 Georgia Hazard Mitigation Strategy and Enhanced Plan

Assets Exposed to the Hazard

The Fayette County HMPC determined that all critical facilities and all public and private property within Fayette County are susceptible to the direct and indirect impacts of an extreme temperature event.

Natural Hazard: Extreme Temperatures

Estimated Potential Losses

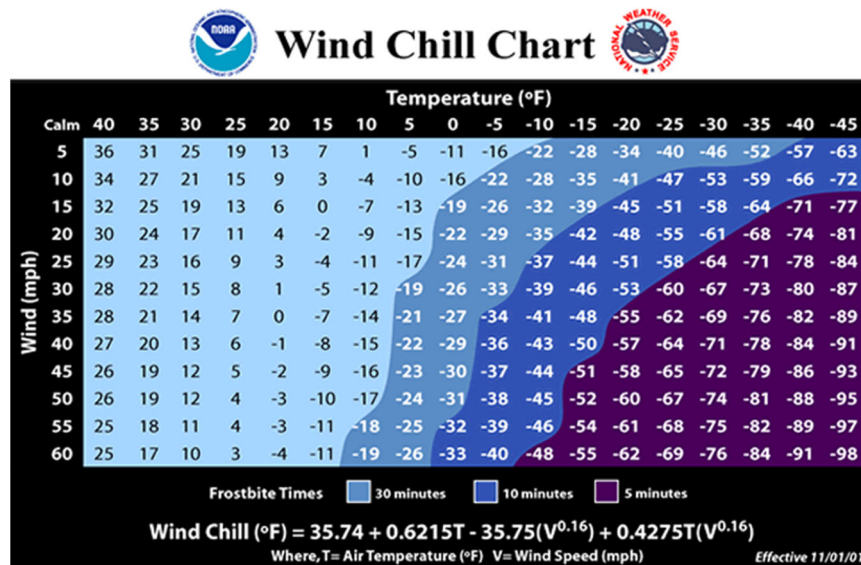

Little information is available regarding damages, in terms of dollars, is available for excessive temperature losses in Fayette County. Most losses for these events have been labeled under other impacts, such as drought and severe winter storms.

Land Use and Development Trends

Fayette County currently has no land use trends related to extreme temperatures beyond increased population growth.

Multi-Jurisdictional Considerations

All of Fayette County, could potentially be threatened by extreme temperatures. As such, all extreme temperature mitigation actions should be pursued on a countywide basis.

Source: National Weather Service

Hazard Summary

Incidents of extreme temperatures – both hot and cold – pose a significant threat to the citizens of Fayette County. Fayette County’s geographical location increases the likelihood of extreme temperature events with extreme heat events generally considered to be more likely. However, the lack of direct preparation for extreme cold events could lead to greater direct impacts.

Technological Hazard: Hazardous Materials*Hazard Description*

Hazardous materials, or hazmat, refers to any materials that may pose a real hazard to human health and/or the environment because of its quantity, concentration, and/or physical or chemical characteristics. Hazardous materials include explosives, flammables, combustibles, oxidizers, toxic materials, radioactive substances, and corrosives. Specific federal and state regulations exist regarding the transport and storage of hazardous materials.

A hazardous materials spill or release occurs when a hazardous material gets into the environment in an uncontrolled fashion. Response to a hazmat spill or release depends greatly on the type of material involved and the subsequent physical and chemical characteristics. Major sources of hazardous materials spills include transportation accidents on roadways and railways, pipeline breaches, and spills into rivers and creeks. Jurisdictions with facilities that produce, process, or store hazardous materials are at risk, as are facilities that treat or dispose of hazardous materials.

Hazard Profile

Data from the United States Coast Guard National Response Center was reviewed regarding hazardous materials spill history in Fayette County. Data is available from 1982 to 2018 and all available data was reviewed. There were 53 NRC reported hazardous materials spills or releases in Fayette County over a 25-year period. It is anticipated that many more hazardous materials incidents have occurred over the last 25 years but have not been reported. According to the NRC data, Fayette County averages 2.1 hazardous materials incidents of a reportable amount each year. This equates to a 0.6% chance of a hazardous materials spill of a reportable amount on any given day. The greatest threat for a hazardous materials spill comes from the transportation of materials through Fayette County. This is particularly true for the Highway 54, 74, and 85 corridors that runs through the center of the county.

Hazardous materials releases can also be the result of railway or fixed facility incidents. Fixed facilities continue to be an increasing concern due to Fayette County's growing industrial footprint. 51% of reported hazardous materials incidents have occurred at fixed facilities.

Of concern to the Fayette County Hazard Mitigation Committee is the exposure of water sources to potential hazardous materials incidents. A hazardous materials incident at or near drinking water sources could have devastating effects on a large population in Fayette County.

Technological Hazard: Hazardous Materials*Assets Exposed to Hazard*

The environment is particularly vulnerable to the threat posed by hazardous materials. Waterways are at a high risk for contamination from hazardous materials. Water contamination is of concern to the Fayette County HMPC. Public and private property located near fixed hazardous materials facilities are also a greater risk than the general population of Fayette County. Water contamination from a hazardous materials release is of particular concern to the Fayette County Hazard Mitigation Planning Committee.

Estimated Potential Losses

Estimation of potential losses is difficult regarding hazardous materials due to the vast array of potential types of hazardous materials that could be involved in the incident and unknown costs regarding environmental damages. No recorded information was found regarding the losses associated with hazardous materials incidents in Fayette County. However, a hazardous materials release, whether in transport or at a fixed facility, would incur significant costs regarding emergency response, potential road closures, evacuations, watershed protection measures, expended man-hours, and cleanup materials, equipment, and personnel.

Land Use and Development Trends

Fayette County currently has no land use trends related to Hazardous Materials beyond continued population growth – particularly in and around the Cities of Fayetteville and Peachtree City.

Multi-Jurisdictional Considerations

All of Fayette County, including all municipalities, are vulnerable to both fixed facility and transportation-related hazardous materials releases. However, areas along the Highway 54, 74, and 85 corridors, including the Cities of Peachtree City and Fayetteville, are of particular concern.

Hazard Summary

Hazardous materials incidents pose a significant threat to the citizens, infrastructure, and critical facilities of Fayette County. Unknown quantities of hazardous materials are transported daily through Fayette County and all municipalities. These materials are often transported via highways. Water contamination because of a hazardous materials spill is of significant concern to the Fayette County HMPC. As a result of the threat posed by hazardous materials, the Fayette County HMPC has identified mitigation actions directly related to this threat.

Technological Hazard: Dam Failure*Hazard Description*

Georgia law defines a dam as any artificial barrier, which impounds or diverts water, is 25 feet or more in height from the natural bed of a stream or has an impounding capacity at maximum water storage evaluation of 100 acre-feet or more. Dams are generally constructed to provide a ready supply of water for drinking, irrigation, recreation, and other purposes. Dams can be constructed from earth, rock, masonry, concrete or any combination of these materials.

Dam failure is a term used to describe a significant breach of a dam and the subsequent loss of contained water. Dam failure can cause significant damages downstream to structures, roads, utilities, and crops. Dam failure can also put human and animal lives at risk. National statistics indicate that one-third of all dam failures in the United States are caused by overtopping due to inadequate spillway design, debris blocking spillways, or settlement of the dam crest. Another third of all US dam failures are the result of foundation defects, including settlement and slope instability.

Hazard Profile

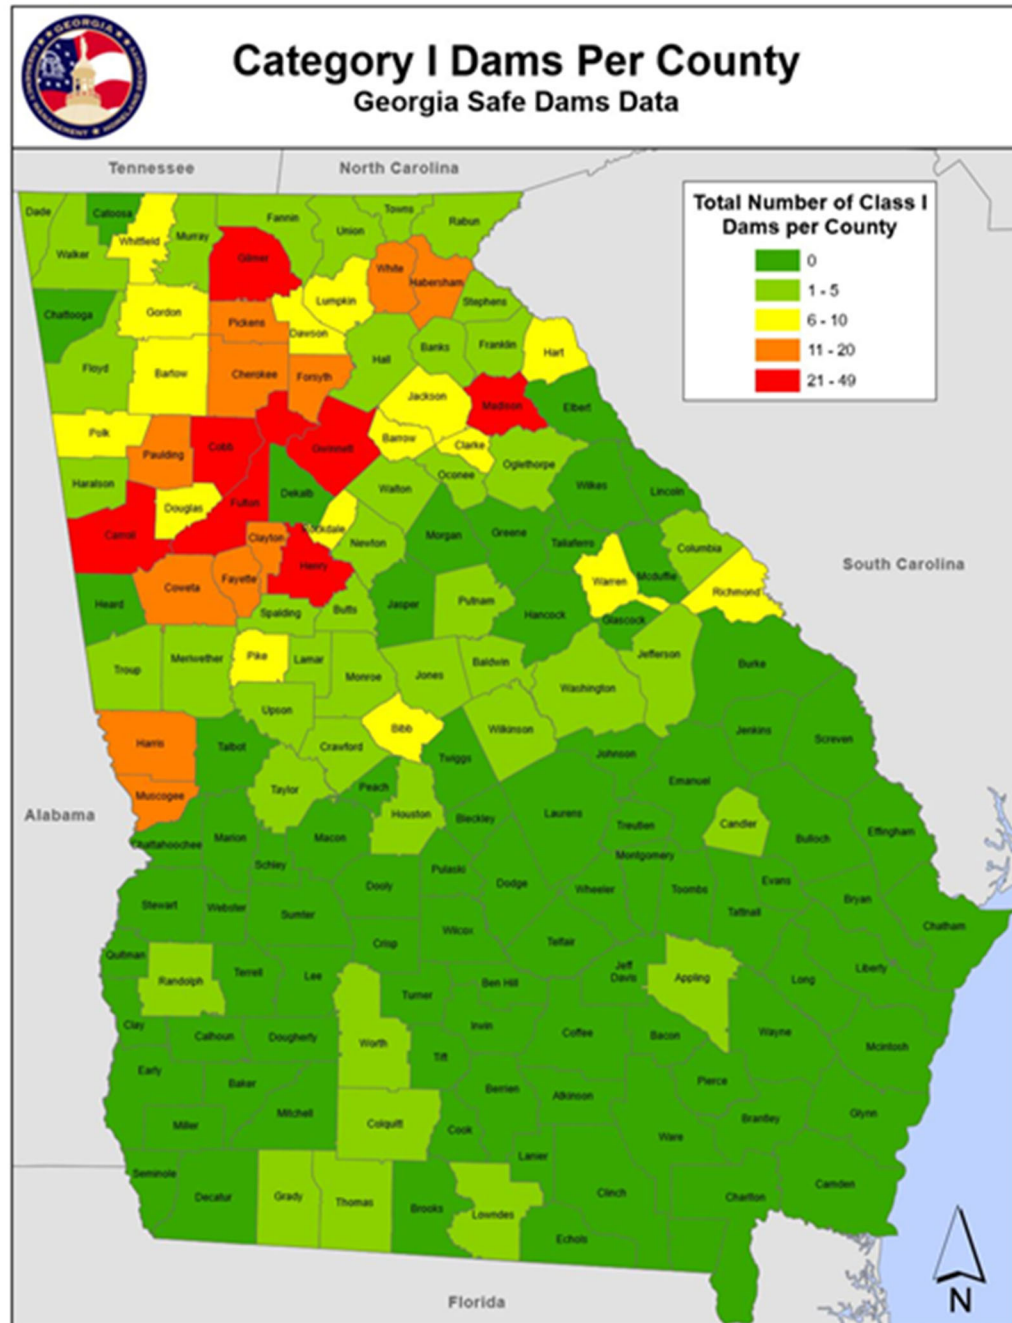

There are 13 category I and 49 category II dams located within Fayette County. Category I dams are those that would pose a possible threat to human life if a failure were to occur. All category I dams must be inspected annually according to Georgia's Safe Dams Act.

The threat of a dam failure in Fayette County could potentially lead to downstream flooding. This downstream flooding would have many of the same hazards as a flood event, but with the onset of such an event being much quicker than in a typical flood event. The 54-foot tall Lake Kedron Dam, 52-foot Horton Creek Reservoir Dam, and 40-foot McIntosh Reservoir Dam are of particular concern because of the large amounts of water stored behind each dam. Lake Kedron has 26,648 acre-feet of storage, McIntosh Reservoir has 20,800 acre-feet of storage, and Horton Creek Reservoir has 18,160 acre-feet of storage.

Assets Exposed to Hazard

To evaluate the assets that would potentially be impacted by a dam failure, the Fayette County HMPC attempted to identify known structures within, or close to, the 100-year floodplain. All municipalities could be exposed to the hazards of other dams or face secondary hazards from the dams.

Technological Hazard: **Dam Failure**

Source: 2019-2024 State of Georgia Hazard Mitigation Strategy and Enhanced Plan

Technological Hazard: Dam Failure*Estimated Potential Losses*

Loss estimations are not applicable since it is not known which dam will fail and how significant of failure will occur.

Land Use and Development Trends

Fayette County participates in the National Flood Insurance Program (NFIP) and follows the program's guidelines to ensure future development is carried out in the best interests of the public. The County (CID No. 130432) first entered the NFIP on July 5, 1983. According to the NFIP guidelines, the County has executed a Flood Damage Prevention Ordinance. This ordinance attempts to minimize the loss of human life and health as well as minimize public and private property losses due to flooding. The ordinance requires any potential flood damage be evaluated at the time of initial construction and that certain uses be restricted or prohibited based on this evaluation. The ordinance also requires that potential homebuyers be notified that a property is located in a flood area. In addition, all construction must adhere to the Georgia State Minimum Standard Codes and the International Building Codes. Currently, all Fayette County municipalities also participate in NFIP through the application of appropriate NFIP-compliant ordinances and regulations.

Multi-Jurisdictional Considerations

During a dam failure event, many portions of Fayette County would potentially be impacted by flooding. However, the area's most prone to flooding have historically been those areas located within the 100-year floodplain and downstream from dams.

Hazard Summary

Dam failure poses a threat to Fayette County and its citizens, infrastructure, and critical facilities. A dam failure could prove catastrophic for areas downstream of the dam, particularly if the failure were to occur at any of the 13 Category I dams located in Fayette County. As a result, mitigation efforts for dam failure should be focused in this potentially affected area.

Technological Hazard: Transportation Incident*Hazard Description*

There are many secondary hazards that could be associated with transportation incidents. Injuries or deaths can occur as a result of the impact of a transportation accident, by a hazardous materials release because of a transportation incident, or by other related transportations hazards. Transportation can occur via roadways, highways, interstates, railways, air, or navigable waterways. Each transportation type poses their own unique hazard issues and consequences.

Roadway hazards are most likely to be caused by a motor vehicle accident involving one or more cars, trucks, vans, or transport vehicles. These incidents can have injuries because of the impact of the MVA or a hazardous materials release into the local environment, including waterways. Railway incidents pose many of the same dangers as motor vehicle accidents. However, the threat of a hazardous materials release is greatly increased when railway transportation incidents are considered.

Air accidents can include commercial airplanes, private airplanes, hot air balloons, helicopters, or other forms of air travel. Each of these incidents can cause a significant threat to human life as well as posing a hazardous material threat due to the cargo being transported or the fuel being used. Navigable waterway incidents can create formidable incidents for response organizations. Because of the waterway, technical expertise is needed to carry out rescue operations, especially in swift-moving waterways. Also, any incident in a waterway is likely to have environmental impacts.

Hazard Profile

Transportation incidents are of a significant concern in Fayette County. Passing through Fayette County are Georgia Highways 54, 74, 85, 92, 138, 279, and 314.

Assets Exposed to Hazard

All assets and critical facilities located along or near any transportation route could potentially be impacted by a transportation incident. Areas within Fayette County that are not located along or near a transportation route could still face residual impacts.

Estimated Potential Losses

Estimated potential losses cannot be anticipated with this event due to the vast number of differing scenarios regarding transportation incidents.

Technological Hazard: Transportation Incident*Land Use and Development Trends*

Fayette County currently has no land use trends related to Transportation Incidents beyond an increase in overall population which, in turn, increases the likelihood and potential impact of a transportation incident. The primary areas of growth have been in and around the Cities of Fayetteville and Peachtree City.

Multi-Jurisdictional Considerations

Fayette County as well as all municipalities could potentially be impacted by a transportation incident. However, areas along the Highway 54, 74, and 85 corridors are the greatest at risk. This includes the Cities of Fayetteville and Peachtree City and the Town of Tyrone.

Hazard Summary

The Fayette County HMPC has determined that transportation incidents pose a high risk to their jurisdictions due to the unpredictable nature and likelihood of the incident. As a result, the Fayette County HMPC has developed mitigation strategies and actions with transportation incidents in mind.

Technological Hazard: Terrorism*Hazard Description*

The Federal Bureau of Investigation (FBI) defines terrorism as violent acts or acts dangerous to human life that violate federal or state law, appear to be intended to intimidate or coerce a civilian population, affect the conduct of a government by mass destruction, assassination or kidnapping, and is calculated to influence or affect the conduct of a government by intimidation or retaliate against government conduct. Terrorism is usually referenced as being premeditated and politically motivated.

Terrorist acts are, by their very nature, designed and carried out with the intention of inflicting mass casualties and extensive property damage. When an act of terrorism is carried out in a jurisdiction, it will likely be necessary to implement multiple aspects of the emergency management system and summon additional resources from local, state, and federal partners.

Terrorism is generally divided into two types: domestic terrorism and international terrorism. Domestic terrorism is defined as terroristic acts focused on facilities and populations without foreign direction. International terrorism involves activities that are foreign-based and/or sponsored by organizations outside of the United States.

Terrorists often use threats to create fear among the public, to convince citizens that government is powerless to prevent terrorism and to get immediate publicity for their causes. Weapons of Mass Destruction (WMDs), including incendiary, explosive, chemical, biological, radiological, and nuclear agents, have the capability to cause death or serious bodily injury to a significant number of people, thus posing the threat of a catastrophic incident. Terrorism can also include arson, agro-terrorism, armed attack, intentional hazardous materials release, water or food contamination, and attacks on infrastructure and electronic information systems.

Hazard Profile

Terrorism targets have historically been facilities that make a large economic or social impact on the targeted government or jurisdiction. In Fayette County, all critical facilities could be potential targets. Terrorism includes a multitude of potential approaches, including agro-terrorism, which is terrorism targeted toward agriculture. Due to the high economic impact (over \$4 million in annual agriculture-related sales) of agriculture in Fayette County, agro-terrorism could be of particular concern. Additionally, a terrorist contamination of the water sources is of concern.

Technological Hazard: **Terrorism**

Within Fayette County, there are many areas that could be viewed as potential targets for terrorism due to their economic impact on the area. This includes tourist-friendly areas, such as the historic district of the City of Fayetteville.

While active shooter situations are not always classified as terrorism, for this plan, the Fayette County HMPC has chosen to classify them as such. Active shooter situations can occur in any location, including businesses, schools, government buildings, and public spaces. Schools are seen as particularly vulnerable to these types of situations due to the high publicity of recent active shooter events. While active shooter events and other acts of terrorism occur worldwide, they have low probability for Fayette County but would have devastating impacts if they were to occur. To help mitigate some of these impacts, Fayette County has exercised an active shooter response in the past to better prepare for any such event.

Assets Exposed to the Hazard

Due to the unpredictable nature of terrorism, all public and private structures are threatened by the terrorism hazard. This includes all critical facilities.

Estimated Potential Losses

Losses due to terrorism are difficult to estimate due to the unpredictable nature of terrorism. The type of terrorist act carried out, location of the act, and the impact of the act would all affect the potential losses. Please see the critical facilities information for estimated potential losses for each critical facility.

Land Use and Development Trends

Fayette County currently has no land use trends related to Terrorism.

Multi-Jurisdictional Considerations

All of Fayette County, including all municipalities, are vulnerable to potential acts of terrorism. However, critical facilities and their surrounding areas are considered to be at the greatest risk.

Hazard Summary

Terrorism, while a low-probability hazard, would have devastating effects on Fayette County and all municipalities. These impacts would be immediate and long-lasting and could be potentially economically crippling to Fayette County and surrounding communities.

Technological Hazard: Infrastructure Failure*Hazard Description*

Infrastructures are particularly vulnerable to both natural and technological hazards. These include electrical utilities, water utilities, gas pipelines, fuel supplies, and other infrastructures that supply vital supplies and services to the community. While an infrastructure failure would most likely be a secondary hazard of one of the other hazards identified in this plan, an infrastructure failure could be a solo incident itself.

A lack of connection with outside sources could lead to public panic, poor emergency response capabilities, and other domino hazards. These events pose a significant threat to many jurisdictions.

Hazard Profile

In case of any failure of a utility infrastructure, general difficulties would be exacerbated for both emergency responders and for the public. The reliance on wireless communications, particularly for the public safety sector, increases the vulnerability of Fayette County's emergency response agencies to a utility failure. Natural gas pipelines traverse the north section of Fayette County while gas transmission pipelines traverse the northwest corner of the county. Both types of pipeline could cause a significant hazardous materials incident if breached or could cause significant gas and natural gas outages across the region if supply were interrupted for an extended period.

Assets Exposed to Hazard

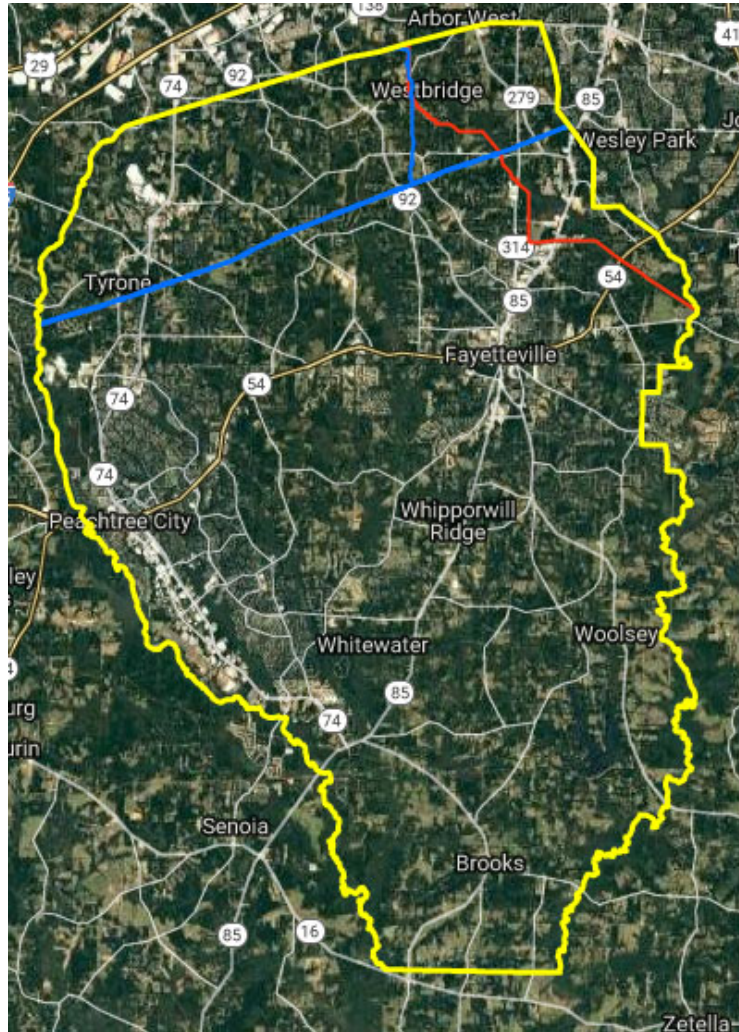

All assets and critical facilities within Fayette County could potentially be impacted by an infrastructure failure.

Estimated Potential Losses

Estimated potential losses cannot be anticipated with this event due to the vast number of differing scenarios regarding utility failure.

Land Use and Development Trends

Fayette County currently has no land use trends related to infrastructure failures beyond continued population growth and an ever-increasing industrial footprint.

Technological Hazard: Infrastructure Failure

Source: National Pipeline Mapping System

Multi-Jurisdictional Considerations

All areas of Fayette County could potentially be impacted by an infrastructure failure.

Hazard Summary

The Fayette County HMPC has determined that utility failures pose a high risk to their jurisdictions due to the unpredictable nature of the incident. As a result, the Fayette County HMPC has developed mitigation strategies and actions with infrastructure failures in mind.

Technological Hazard: Emergent Infectious Diseases*Hazard Description*

Microorganisms, such as bacteria, viruses, parasites, fungi, or prions, surround us within the environment. They can even be found within our own bodies. Most microorganisms are completely harmless, and many are actually beneficial. However, some of these organisms are pathogenic, meaning they cause or can cause disease. Infectious diseases are caused by these pathogenic organisms and are communicable – meaning they can be spread from person to person either directly or indirectly. Direct transmission of the disease occurs through actual physical contact with an infected person or their bodily fluids. Indirect transmission of a disease occurs when an infected person contaminates a surface by sneezing, coughing, etc., and a non-infected person comes into contact with that infected surface. Another means of indirect transmission includes vectors, such as mosquitos, flies, mites, ticks, fleas, rodents, or dogs, which may carry the pathogenic microorganism and transmit it to people via a bite. Infectious diseases can also impact animal populations, particularly livestock and other farm animals. Even though these diseases may not directly affect humans, the economic impact of these diseases can be just as harmful, if not more so, to the community.

Infectious diseases can occur as primary events or they may occur as a cascading result of another disaster, such as a tornado, flood, or winter weather. Infectious diseases can vary greatly in severity and magnitude. According to the World Health Organization, infectious diseases account for three of the ten leading causes of death worldwide – HIV/AIDS, lower respiratory infections, and diarrheal disease. These three events, combined with tuberculosis and malaria, account for 20% of deaths globally.

In Western countries, the impact of infectious diseases has diminished greatly over the last 75 years due to improved sanitation, personal hygiene, vaccinations, and the use of antibiotics. In the United States, only two infectious diseases – seasonal influenza and pneumonia – rank in the top ten leading causes of death. Annually, there are 1,500 deaths in the United States from seasonal influenza and another 52,000 from pneumonia. Children and older adults are the greatest at risk for both.

Emergent infectious diseases are those that are appearing in a population for the first time. Re-emergent infectious diseases are those that may have previously existed in a population, but levels had dropped to the point where it was no longer considered a public health problem until levels once again began increasing.

Technological Hazard: Emergent Infectious Diseases

During the last 25 years, emergent and re-emergent infectious diseases have been on the rise. The below table outlines some of the contributing factors to this rise:

| Contributing Factors to Increasing Occurrence of Emergent Diseases | |
|--|--|
| Agent-Related Factors | |
| <ul style="list-style-type: none"> • Evolution of pathogenic infectious agents • Development of resistance to drugs • Resistance of disease carriers to pesticides | |
| Host-Related Factors | |
| <ul style="list-style-type: none"> • Human demographic changes (humans inhabiting new areas) • Human behavior (sexual practices and drug use) • Human susceptibility to infection | |
| Environment-Related Factors | |
| <ul style="list-style-type: none"> • Economic development and land use patterns • International travel and commerce • Deterioration of surveillance systems | |

Due to a lack of ready-made vaccines for these diseases and a lack of immunity in the population, emergent and re-emergent infectious diseases are much more likely to escalate to pandemic levels rapidly.

| CDC-Identified Emergent and Re-Emergent Infectious Diseases | |
|---|--|
| Drug-resistant Infections | Mad Cow/Variant Creutzfeldt-Jakob Diseases |
| Campylobacteriosis | Chagas Disease |
| Cholera | Cryptococcosis |
| Cryptosporidiosis (Crypto) | Cyclosporiasis |
| Cysticercosis | Dengue Fever |
| Diphtheria | Ebola Hemorrhagic Fever |
| Group B Streptococcal Infection | Hantavirus Pulmonary Syndrome |
| Hepatitis C | Hendra Virus Infection |
| Histoplasmosis | HIV/AIDS |
| Influenza | Lassa Fever |
| Legionnaires' Disease and Pontiac Fever | Leptospirosis |
| Listeriosis | Lyme Disease |
| Malaria | Marburg Hemorrhagic Fever |
| Measles | Meningitis |
| Monkeypox | MRSA |
| Nipah Virus Infection | Norovirus Infection |
| Pertussis | Plague |
| Polio | Rabies |
| Rift Valley Fever | Rotavirus Infection |
| Salmonellosis | SARS |
| Shigellosis | Smallpox |
| Sleeping Sickness (Trypanosomiasis) | Tuberculosis |
| Tularemia | Valley Fever (Coccidioidomycosis) |
| VISA/VRSA | Staphylococcus Aureus |
| West Nile Virus Infection | Yellow Fever |

Technological Hazard: Emergent Infectious Diseases*Hazard Profile*

Emergent Infectious diseases are of significant concern to the Fayette County HMPC, particularly those that would have an impact on the human population or animal population of Fayette County. Fayette County would likely see significant economic impacts from an outbreak involving animal populations, such as an Avian Flu, due to the large economic base agriculture provides (over \$120 million in annual sales). The lack of current vaccines and preparatory activities for these diseases has created a situation where the potential impact to Fayette County of a pandemic or epidemic could be catastrophic. The most recent pandemic scare in the Central Georgia area was the 2009-2010 H1N1 Swine Flu. There were 1286 cases of H1N1 in Georgia in 2009-2010 and 33 deaths. Most registered cases occurred with people between the ages of 5 and 29. This equates to a mortality rate of just over 2.5% - which is slightly lower than the 3% rate of the 1918-1919 Spanish Flu Pandemic. The 2019-2020 COVID-19 Pandemic, which was caused by SARS-CoV2, spread worldwide in a matter of weeks. As of June 18, 2020, there were 8.3 million cases reported worldwide with nearly 450,000 deaths. In Fayette County, there were 271 confirmed cases and 16 deaths.

Technological Hazard: Emergent Infectious Diseases

Over the last 25 years, emergent infectious disease outbreaks have occurred in other parts of the country. These include:

- 1993 Cryptosporidium Outbreak (Milwaukee, Wisconsin – 403,000 people ill and 100 deaths)
- 2010 Whooping Cough Outbreak (California – 9,500 people ill and 10 infant deaths)
- 2015 H5N2 Avian Flu Outbreak (Midwest – over 25 million chickens and turkeys destroyed as a precautionary measure at 83 locations)

Assets Exposed to the Hazard

Due to the unpredictable nature of emergent infectious diseases, all public and private structures are threatened by the hazard. This includes all critical facilities.

Estimated Potential Losses

Losses due to emergent infectious diseases are difficult to estimate due to the unpredictable nature of the hazard. The type of emergent infectious disease, location of the outbreak, and the impact of the outbreak would all affect the potential losses. Please see the critical facilities information for estimated potential losses for each critical facility.

Land Use and Development Trends

Fayette County currently has no land use trends directly related to emergent infectious diseases.

Multi-Jurisdictional Considerations

All of Fayette County, including all municipalities, are vulnerable to emergent infectious diseases. However, livestock and other farm animals are considered to be the greatest at risk, along with areas that have a large, concentrated human population, such as schools.

Hazard Summary

An emergent infectious disease would have devastating effects on Fayette County and all municipalities. These impacts would be immediate and long-lasting and could be potentially economically crippling. Because of these considerations, the Fayette County HMPC has developed mitigation actions with emergent infectious diseases in mind.

CHAPTER FOUR

–

HAZARD MITIGATION STRATEGIES

Summary of Updates to Chapter Four

The following table provides a description of each section of this chapter, and a summary of the changes that have been made to the Fayette County Hazard Mitigation Plan 2015.

| Chapter 4 Section | Updates |
|--|---|
| Goals and Objectives | <ul style="list-style-type: none">• Updated goals to match the needs of Fayette County and all municipalities |
| Identification and Analysis of Mitigation Techniques | <ul style="list-style-type: none">• Content Revised• Reviewed mitigation strategies identified in the 2015 plan and made updates• Identified mitigation strategies that were completed• Identified mitigation strategies to be removed |

Goals and Objectives

Requirement §201.6(c)(3)

Requirement §201.6(c)(3)(i)

It is important that State and local government, public-private partnerships, and the average citizen can see the results of these mitigation efforts, therefore, the goals and strategies need to be achievable. The mitigation goals and objectives form the basis for the development of specific mitigation actions. County and municipal officials should consider the listed goals before making community policies, public investment programs, economic development programs, or community development decisions for their communities. The goals of Fayette County have changed slightly in the last five years (since 2015) due to specific threat events, such as Hurricane Irma in 2017. Because of the recentness of the impacts of these hazards and the devastation that occurred, these types of events have taken a greater priority, particularly in the increased priority of mitigation strategies directly related to these events and the development of new mitigation strategies related to these hazards.

Each jurisdiction covered by the Fayette County Hazard Mitigation plan update – Fayette County and the Municipalities of Brooks, Fayetteville, Peachtree City, Tyrone, and Woolsey – has limited ability to fully implement the mitigation actions described in this plan. These jurisdictions are severely hampered by their small population and tax base when attempting to raise enough revenue to pursue many of these actions. All jurisdictions lack the needed financial strength and staffing to implement all the actions described in this plan. Many of the actions will be pursued through grant programs and by partnering with public and private organizations who can supplement the needed resources to accomplish the goals outlined in this plan. For actions where grant funding or partnerships are not available, Fayette County or municipality revenue streams may be supplemented through Special Purpose Local Option Sales Tax (SPLOST) funds, which are voted on by the electorate.

- | | |
|--------|---|
| GOAL 1 | Maximize the use of all resources by promoting intergovernmental coordination and partnerships in the public and private sectors |
| GOAL 2 | Harden communities against the impacts of disasters through the development of new mitigation strategies and strict enforcement of current regulations that have proven effective |
| GOAL 3 | Reduce and, where possible, eliminate repetitive damage, loss of life and property from disasters |

GOAL 4 Bring greater awareness throughout the community about potential hazards and the need for community preparedness

These objectives state a more specific outcome that Fayette County strives to accomplish over the next five years. Action steps are the specific steps necessary to achieve these objectives. Objectives are not listed in order of importance.

- OBJECTIVE 1** Reduce damage to property and loss of life through the utilization of preventative activities
- OBJECTIVE 2** Minimize the damage to property and loss of life through property protection measures
- OBJECTIVE 3** Minimize the damage to property and loss of life through natural resource protection activities
- OBJECTIVE 4** Reduce damage to property and loss of life through the utilization of structural mitigation projects
- OBJECTIVE 5** Increase the ability of Fayette County, its municipalities, and its citizens to respond to natural and manmade hazards through emergency service measures
- OBJECTIVE 6** Increase public education and awareness of natural hazards
- OBJECTIVE 7** Minimize the impacts on local citizens, industry, and infrastructure of a dam breach
- OBJECTIVE 8** Implement additional protective measures and capabilities in response to manmade incidents
- OBJECTIVE 9** Increase public awareness of local manmade hazards and proper response to those hazards

Identification and Analysis of Mitigation Techniques

Requirement §201.6(c)(3)(iv)

Requirement §201.6(c)(3)(iii)

In updating Fayette County's mitigation strategy, a wide range of activities were considered to help achieve the mitigation goals and objectives. This includes the following activities as by the Emergency Management Accreditation Program (EMAP):

- 1) The use of applicable building construction standards;
- 2) Hazard avoidance through appropriate land-use practices;
- 3) Relocation, retrofitting, or removal of structures at risk;
- 4) Removal or elimination of the hazard;
- 5) Reduction or limitation of the amount or size of the hazard;
- 6) Segregation of the hazard from that which is to be protected;
- 7) Modification of the basic characteristics of the hazard;
- 8) Control of the rate of release of the hazard;
- 9) Provision of protective systems or equipment for both cyber and/or physical risks;
- 10) Establishment of hazard warning and communication procedures; and
- 11) Redundancy or duplication of essential personnel, critical systems, equipment, and information materials.

Part of the prioritization includes a general assessment according to the STAPLEE criteria, which stands for Social, Technical, Administrative, Political, Legal, Economic and Environmental. This process led to three designated priorities: High, Medium, and Low. Most items that require grant funding must undergo a full Benefit Cost Analysis to determine the action's actual cost effectiveness prior to funding. This process will be completed as part of the grant opportunity application process.

| Strategy Priority | Priority Description | Strategies within this priority |
|-------------------|--|---|
| LOW | Low priority strategies are those strategies that will have less direct impact on mitigating Fayette County's hazards, are in the early stages of strategy development, or score poorly on a preliminary cost-benefit analysis | 3.a; 3.b; 3.c; 3.f; 3.g; 3.h; 4.o; 4.p; 4.r; 5.n; 5.p; 8.f |
| MEDIUM | Medium priority strategies are those strategies that will have a direct impact on mitigation Fayette County's hazards, but will not have as large of an anticipated impact as High Priority strategies or may be focused on hazards that are not as potentially impactful or prevalent for Fayette County. These strategies may be in the earlier stages of development or score mediocre on a preliminary cost-benefit analysis | 1.a; 1.d; 1.e; 1.f; 2.a; 2.b; 2.c; 2.d; 2.e; 2.f; 2.g; 2.h; 2.i; 2.j; 2.k; 2.l; 2.m; 2.n; 3.d; 3.e; 3.i; 3.j; 4.a; 4.b; 4.f; 4.g; 4.h; 4.k; 4.m; 4.t; 4.v; 4.w; 4.y; 5.a; 5.c; 5.d; 5.f; 5.g; 5.i; 5.j; 5.o; 5.q; 5.r; 5.s; 5.t; 5.u; 6.a; 7.b; 7.c; 7.d; 7.f; 7.g; 8.a; 8.b; 8.e |
| HIGH | High priority strategies are those strategies that would have a direct, large impact on mitigation Fayette County's hazards. These strategies are oftentimes well-established needs of Fayette County and/or all municipalities and have score high on a preliminary cost-benefit analysis | 1.b; 1.c; 1.g; 1.h; 1.i; 1.j; 4.c; 4.d; 4.e; 4.i; 4.j; 4.l; 4.n; 4.q; 4.s; 4.u; 4.x; 5.b; 5.e; 5.h; 5.k; 5.l; 5.m; 6.b; 6.c; 7.a; 7.e; 8.c; 8.d; 9.a |

The lead agency listed in the Mitigation Strategy charts will be responsible for the jurisdictional administration and implementation of the mitigation strategy prioritization. Prioritization was determined based on many factors. These include the likelihood of the event, the potential impact of the event, the current readiness posture of Fayette County for the event, the all-hazard impact of the mitigation strategy, and a cost-benefit analysis for the mitigation action. For example, mitigation actions that address high-likelihood, high-impact events with a low cost would rate higher than low-likelihood, high-impact events with a high cost.

The following Mitigation Charts meet:

[Requirement §201.6\(c\)\(3\)\(ii\)](#)

[Requirement §201.6\(d\)\(3\)](#)

| Strategy # | Mitigation Action | Lead and Supporting Agency, Department, Organization <i>Jurisdiction</i> | Flood | Winter Weather | Thunderstorm | Tornado | Tropical Cyclone | Drought/Ex Temp | Wildfire | Earthquake | Funding Source | Estimated Cost | Completion Timeframe | Progress/ Status | Priority | Previous Strategy # |

OBJECTIVE 2: Minimize the damage to property and loss of life through property protection measures

| Strategy # | Mitigation Action | Lead and Supporting Agency, Department, Organization <i>Jurisdiction</i> | Flood | Winter Weather | Thunderstorm | Tornado | Tropical Cyclone | Drought/Ex Temp | Wildfire | Earthquake | Funding Source | Estimated Cost | Completion Timeframe | Progress/ Status | Priority | Previous Strategy # |
|------------|---|---|-------|----------------|--------------|---------|------------------|-----------------|----------|------------|--|------------------------------|----------------------|------------------------------------|----------|---------------------|
| 2.a | Install generator and transfer switch at Tyrone Municipal Complex | Tyrone City Council <i>Fayette County and Tyrone</i> | | X | X | X | X | | | | Public and private grants and/or local budgets | \$150,000 | 48 months | NEW | Medium | NEW |
| 2.b | Encourage retrofitting of existing and future public schools with special high wind resistant fil for doors and windows | Fayette County BOE <i>Fayette County and all municipalities</i> | | | X | X | X | | | | Public and private grants and/or local budgets | \$20,000 per school | 48 months | None, due to budgetary constraints | Medium | Tornado 1.1.1 |
| 2.c | Encourage retrofitting of existing and future county and municipal buildings with special high wind resistant fil for doors and windows | Fayette County EMA and BOC <i>Fayette County and all municipalities</i> | | | X | X | X | | | | Public and private grants and/or local budgets | \$10,000-20,000 per building | 60 months | NEW | Medium | NEW |
| 2.d | Purchase backup mobile generator and automated transfer switch for the City of Fayetteville Public Services Department | Fayetteville Public Services Department <i>City of Fayetteville</i> | | X | X | X | X | | | X | Public and private grants and/or local budgets | \$50,000 | 48 months | NEW | Medium | NEW |

| Strategy # | Mitigation Action | Lead and Supporting Agency, Department, Organization <i>Jurisdiction</i> | Flood | Winter Weather | Thunderstorm | Tornado | Tropical Cyclone | Drought/Ex Temp | Wildfire | Earthquake | Funding Source | Estimated Cost | Completion Timeframe | Progress/ Status | Priority | Previous Strategy # |
|------------|---|---|-------|----------------|--------------|---------|------------------|-----------------|----------|------------|--|----------------|----------------------|------------------------------------|----------|------------------------|
| 2.e | Purchase backup mobile generator and enclosed trailer with lighting system for the Fayette County School System | Fayette County BOE <i>Fayette County and all municipalities</i> | | X | X | X | X | | | X | Public and private grants and/or local budgets | \$75,000 | 48 months | NEW | Medium | NEW |
| 2.f | Upgrade the 20-year old generator at Fayette County Public Works and add transfer switch | Fayette County Public Works <i>Fayette County and all municipalities</i> | | X | X | X | X | | | X | Public and private grants and/or local budgets | \$50,000 | 48 months | NEW | Medium | NEW |
| 2.g | Acquire a mobile backup generator for the Town of Tyrone | Tyrone Police Department and Public Works <i>Town of Tyrone</i> | | X | X | X | X | | | X | Public and private grants and/or local budgets | \$55,000 | 48 months | None, due to budgetary constraints | Medium | All Hazards Addendum 2 |
| 2.h | Install generator at Station 91 in Fayetteville | Fayetteville Fire Department and EMA <i>City of Fayetteville</i> | | X | X | X | X | | | X | Public and private grants and/or local budgets | \$55,000 | 36 months | NEW | Medium | NEW |

| Strategy # | Mitigation Action | Lead and Supporting Agency, Department, Organization <i>Jurisdiction</i> | Flood | Winter Weather | Thunderstorm | Tornado | Tropical Cyclone | Drought/Ex Temp | Wildfire | Earthquake | Funding Source | Estimated Cost | Completion Timeframe | Progress/ Status | Priority | Previous Strategy # |
|------------|--|---|-------|----------------|--------------|---------|------------------|-----------------|----------|------------|--|----------------|----------------------|------------------|----------|---------------------|
| 2.i | Install generator at Real Life Center to allow it to be able to accept donations during a disaster event | Real Life Center <i>Fayette County and all municipalities</i> | X | X | X | X | X | | | X | Public and private grants and/or private budgets | \$75,000 | 60 months | NEW | Medium | NEW |
| 2.j | Install a generator and automatic transfer switch for Piedmont Fayette Central Plant | Piedmont Fayette <i>Fayette County and all municipalities</i> | | X | X | X | X | | | X | Public and private grants and/or private budgets | \$100,000 | 60 months | NEW | Medium | NEW |
| 2.k | Replace current hospital generator and ATS at Piedmont Fayette | Piedmont Fayette <i>Fayette County and all municipalities</i> | | X | X | X | X | | | X | Public and private grants and/or private budgets | \$500,000 | 60 months | NEW | Medium | NEW |
| 2.l | Purchase and install a generator for any needed location in the Piedmont Fayette campus and any accompanied and identified ATS | Piedmont Fayette <i>Fayette County and all municipalities</i> | | X | X | X | X | | | X | Public and private grants and/or private budgets | \$300,000 | 60 months | NEW | Medium | NEW |

| Strategy # | Mitigation Action | Lead and Supporting Agency, Department, Organization <i>Jurisdiction</i> | Flood | Winter Weather | Thunderstorm | Tornado | Tropical Cyclone | Drought/Ex Temp | Wildfire | Earthquake | Funding Source | Estimated Cost | Completion Timeframe | Progress/ Status | Priority | Previous Strategy # |
|---|--|---|-------|----------------|--------------|---------|------------------|-----------------|----------|------------|--|----------------|----------------------|------------------------------------|----------|---------------------|
| 2.m | Purchase ATS to connect to portable generator as backup for existing generator | Piedmont Fayette <i>Fayette County and all municipalities</i> | | X | X | X | X | | | X | Public and private grants and/or private budgets | \$50,000 | 24 months | NEW | Medium | NEW |
| 2.n | Build a tornado safe room at Fayette County Public Works facility | Fayette County Public Works and EMA <i>Fayette County and all municipalities</i> | | | X | X | X | | | | Public and private grants and/or local budgets | \$200,000 | 48 months | NEW | Medium | NEW |
| OBJECTIVE 3: Minimize the damage to property and loss of life through natural resource protection activities | | | | | | | | | | | | | | | | |
| 3.a | Implement a corrective action plan to upgrade/remove mobile home wastewater treatment systems located within the areas of Special Flood Hazard on both Morning and Whitewater Creeks | Fayette County Environmental Management <i>Fayette County</i> | X | | | | X | | | | Public and private grants and/or local budgets | \$50,000 | 60 months | None, due to budgetary constraints | Low | Flood 1.1.4 |

| Strategy # | Mitigation Action | Lead and Supporting Agency, Department, Organization <i>Jurisdiction</i> | Flood | Winter Weather | Thunderstorm | Tornado | Tropical Cyclone | Drought/Ex Temp | Wildfire | Earthquake | Funding Source | Estimated Cost | Completion Timeframe | Progress/ Status | Priority | Previous Strategy # |
|------------|---|--|-------|----------------|--------------|---------|------------------|-----------------|----------|------------|--|--------------------------|----------------------|--|----------|-------------------------------|
| 3.b | Dredge portions of Starr's Mill pond to help reduce flooding at historic Starr's Mill and improve flow of water to the raw water pump station that provides water to the Crosstown Water Treatment Plan | Fayette County Water System <i>Fayette County</i> | X | | | | X | | | | Public and private grants and/or local budgets | \$2 million | 60 months | None, due to budgetary constraints and poor CBA | Low | Flood 1.1.5 |
| 3.c | Dredge Pye Lake to increase flood control | Fayetteville Engineering <i>City of Fayetteville</i> | X | | | | X | | | | Public and private grants and/or local budgets | \$600,000 to \$1 million | 60 months | Dam reconstructed; Lake pool lowered as a result | Low | Flood Fayetteville Addendum |
| 3.d | Perform creek bank stabilization project to control erosion and reduce damage to buildings | Fayette County Engineering and Property Owner <i>City of Fayetteville</i> | X | | | | X | | | | Private and local funds | \$100,000 | 48 months | Planning and discussions ongoing | Medium | Flood Fayetteville Addendum 5 |

| Strategy # | Mitigation Action | Lead and Supporting Agency, Department, Organization <i>Jurisdiction</i> | Flood | Winter Weather | Thunderstorm | Tornado | Tropical Cyclone | Drought/Ex Temp | Wildfire | Earthquake | Funding Source | Estimated Cost | Completion Timeframe | Progress/ Status | Priority | Previous Strategy # |
|------------|---|--|-------|----------------|--------------|---------|------------------|-----------------|----------|------------|--|----------------|----------------------|------------------|----------|----------------------------|
| 3.e | Design and implement stabilization projects at eroding bank areas in the Lake Peachtree Watershed | Peachtree City Stormwater <i>City of Peachtree City and Fayette County</i> | X | | | | X | | | | Public and private grants and/or local budgets | \$1 million | 60 months | Planning ongoing | Medium | Peachtree City Flood 1.1.2 |
| 3.f | Restore stream in Hunters Glen subdivision to decrease erosion | Fayetteville Public Services and Fayette County Environmental Management <i>Fayetteville and Fayette County</i> | X | | X | | X | | | | Public and private grants and/or local budgets | \$3 million | 60 months | NEW | Low | NEW |
| 3.g | Restore stream in Oak Street basin to decrease erosion and minimize flooding | Fayetteville Public Services and Fayette County Environmental Management <i>Fayetteville and Fayette County</i> | X | | X | | X | | | | Public and private grants and/or local budgets | \$4 million | 60 months | NEW | Low | NEW |

Completed Mitigation Strategies

| Previous Strategy # | Strategy Description | Status |
|-----------------------------------|---|---|
| Flood 1.1.6 | Enforce floodplain management requirements, including regulating new construction in special flood hazard area | COMPLETE; Modified to “Continue” |
| Flood 1.1.8 | Replace existing bridge over the Flint River on West McIntosh Road | COMPLETE |
| Flood 1.1.9 | Repair and/or replace existing drainpipes and stabilize eroding areas below and around the Emerald Lake Dam’s primary drainpipes | COMPLETE |
| Flood 1.1.10 | Replace existing 6-foot diameter CMP on unnamed tributary to Haddock Creek with concrete pipe or box culverts on Rising Star Road | COMPLETE |
| Flood 1.1.14 | Implement pipe replacement project to control flooding over the road at 330 Oak Street in Fayetteville | COMPLETE |
| Flood 1.1.15 | Replace the existing twin, 84-inch diameter corrugated metal pipes under Antebellum Way in Jeff Davis Plantation Subdivision | COMPLETE |
| Peachtree City Flood 1.1.4 | Increase the size of storm drains in the Golfview Subdivision | COMPLETE |
| Peachtree City Flood 1.1.5 | Increase the size of storm drains in the Harbor Loop subdivision *Alternate Strategy: purchase the homes in the subdivision that flood and demolish them | COMPLETE – Alternate strategy utilized because it was 25% of the cost |
| Tyrone Flood 1.1.1 | Acquire additional barricades for emergency road closures | COMPLETE; Modified for all jurisdictions to acquire |
| Tornado 1.1.2 | Complete build out of weather warning siren system with the installation of four additional sirens | COMPLETE |
| T-Storms 1.1.3 | Replace generator at Fire Station 6 in Brooks | COMPLETE with Hazard Mitigation Grant Funds |
| All-Hazards 1.1.2 | Work with local cable and radio providers to develop and broadcast public education on Emergency Preparedness | COMPLETE; Modified to be an annual strategy |
| Dam Failure 1.1.1 | Implement the City of Fayetteville’s corrective action plan for Pye Lake Dam | COMPLETE |

| | | |
|---------------------------|---|----------|
| Dam Failure 1.1.7 | Implement maintenance and operational improvement at the Emerald Lake Dam | COMPLETE |
| Dam Failure 1.1.10 | Replace and upgrade the 50-year old concrete spillway structure at Lake Peachtree | COMPLETE |

Deleted Mitigation Strategies

| Previous Strategy # | Strategy Description | Reason |
|--------------------------|---|--|
| All Hazards 1.1.1 | Place severe weather sirens in all public parks and recreation facilities | <i>Duplicate of Strategy T-Storms 1.1.1</i> |
| HazMat 1.1.1 | Conduct a hazardous materials exercise | <i>County relies on mutual aid for hazardous materials team assistance</i> |
| HazMat 1.1.2 | Purchase additional hazardous materials response equipment necessary to sustain hazardous materials response operations | <i>County relies on mutual aid for hazardous materials team assistance</i> |
| HazMat 1.1.3 | Work with and encourage industry to reduce chemical inventories at fixed facilities | <i>LEPC no longer a standing committee</i> |
| Dam Fail 1.1.4 | Strictly enforce zoning ordinance to eliminate building structures below Category I dams | <i>Not legal to zone out in this way</i> |

CHAPTER FIVE
–
MAINTENANCE AND
IMPLEMENTATION

Summary of Updates for Chapter Five

The following table provides a description of each section of this chapter, and a summary of the changes that have been made to the Fayette County Hazard Mitigation Plan 2015.

Maintenance

Requirement §201.6(c)(4)(iii)

To adhere to best practices, state and federal guidelines, and lessons learned, the Fayette County Hazard Mitigation Plan Update Committee has developed a method to ensure the regular review and update of the Plan occurs. Plan maintenance protocols identified during the 2015 Fayette County Hazard Mitigation Plan was followed, to the best abilities of Fayette County. This most importantly included an increased attempt for public participation and inclusion in the planning process. The Fayette County Hazard Mitigation Plan Update Committee will reconvene annually in February to monitor and evaluate the progress of the mitigation strategies in the Plan. Fayette County's Emergency Management Director, Mike Singleton, will be responsible for implementing this meeting. The Committee will discuss the following questions annually:

- Do the goals address current and expected hazards and conditions?
- Are the goals and objectives still relevant to the County?
- Has the nature or magnitude of risks changed?
- Does the risk assessment portion of the Plan need to be updated or modified?
- Are the goals and objectives meeting changes in state and federal policy?
- Are the current resources appropriate for implementing the Plan?
- Are there local implementation problems, such as technical, political, legal, or coordination issues with other agencies?
- Did the jurisdictions, agencies, and other partners participate in the plan implementation process as proposed?

The responsible parties for various mitigation strategies will provide a report during this annual meeting regarding the following:

- How well did the implementation processes work?
- Were any difficulties encountered during implementation?
- How successful was the coordination of efforts?
- Are there any suggestions for revision of any strategies?

Fayette County's Emergency Management Director will send the minutes from this annual meeting to Fayette County Board of Commissioners and the municipalities of Brooks, Fayetteville, Peachtree City, Tyrone, and Woolsey for review.

If there are any updates or modifications to the Fayette County Hazard Mitigation Plan, the Emergency Management Director will forward the changes to the Georgia Emergency Management Agency's Hazard Mitigation Officer. All annual reviews of the Fayette County Hazard Mitigation Plan will be open to the public. These meetings will be advertised both in the local newspapers, but also on signage in the publicly used facility hosting the meeting.

Plan Distribution

This Plan will be distributed, but not limited, to the following departments and organizations within Fayette County:

Fayette County Board of Commissioners
Fayette County Fire Department
Fayette County Emergency Management Agency
Fayette County Sheriff's Office
Fayette County Public Works
Fayette County Code Enforcement
Fayette County Board of Education
City of Fayetteville
City of Peachtree City
City of Tyrone
Town of Brooks
Town of Woolsey

A printed copy of the approved Plan will be available for viewing at the Fayette County Commissioner's Office located at 140 Stonewall Avenue West in Fayetteville, GA 30214. A printed copy of the approved Plan will also be available for viewing at the Fayette County Public Library located at 1821 Heritage Park Way in Fayetteville. The existence and location of these copies will be publicized in the County's local newspaper, The Citizen.

All comments, questions, concerns, and opinions about the Plan will be directed to Director Mike Singleton of the Fayette County Emergency Management Agency for follow-up.

Implementation[Requirement §201.6\(c\)\(4\)\(ii\)](#)

Each jurisdiction participating in the Fayette County Hazard Mitigation Plan is responsible for implementing specific mitigation actions as prescribed in this plan. In the Mitigation Strategies section, every proposed strategy is assigned to a specific local department or agency to assign responsibility and accountability and increase the likelihood of subsequent implementation.

In addition to the designation of a local lead department or agency, some strategies have secondary or assisting department or agencies listed as well. This allows for a sharing of responsibility and coordination of effort for some of the identified strategies that cross lines of departmental responsibility. The completion date has been assigned to assess whether identified mitigation strategies are being implemented in a timely fashion.

Fayette County and all municipalities will seek outside funding sources to implement mitigation projects in both the pre-disaster and post-disaster environments. When applicable, potential funding sources have been identified and targeted for the proposed actions listed in the mitigation strategies. It will be the responsibility of each participating jurisdiction to determine additional implementation procedures beyond those listed within the Fayette County Hazard Mitigation Plan.

This plan, as a joint effort between Fayette County and the Municipalities of Brooks, Fayetteville, Peachtree City, Tyrone, and Woolsey will serve as a comprehensive mitigation plan. The mitigation strategies, hazard identification, and other information identified in this plan will be integrated into all comprehensive Fayette County plans, as well as all municipality plans in the future. Incorporation of these strategies will occur, as necessary, throughout this planning cycle covered by this Hazard Mitigation Plan Update. Aspects of this plan will be integrated into the Fayette County Comprehensive Plan during the next planning cycle.

Identified hazards and mitigation strategies of the 2015 Fayette County Hazard Mitigation plan were integrated into the Local Emergency Operations Plan, multiple County and City SOPs and SOGs, and future planning and zoning plans. Fayette County will integrate mitigation strategies identified in this plan into the Fayette County Comprehensive Plan, Community Wildfire Protection Plan, Continuity of Operations Plan, and other future plans. Strategies identified in the previous plan were applied to grant applications, building and zoning requirements, and development planning considerations for Fayette County and all municipalities. Many of these strategies will be applied using previously identified policies and

ordinances, including the NFIP compliance ordinances and water-use ordinances, which have now been applied countywide. All jurisdictions have the authority to adopt locally binding ordinances and policies to enhance the mitigation strategies in their jurisdiction.

The Legal and Regulatory Capability survey documents authorities available to the jurisdiction and/or enabling legislation at the state level affecting planning and land management tools that support local hazard mitigation planning efforts. The identified planning and land management tools are typically used by states and local jurisdictions to implement hazard mitigation activities.

| Regulatory Tools/Plans | Regulatory Type: Ordinance, Resolution, Codes, Plans, Etc. | Local Authority | State Prohibited | Higher Authority |
|---|--|-----------------|------------------|------------------|
| Building Codes | County/Municipal Code | Yes | No | No |
| Capital Improvements Plan | | Yes | No | No |
| Comprehensive Plan | Fayette County Comprehensive Plan | Yes | No | No |
| Economic Development Plan | Fayette County Comprehensive Plan | Yes | No | Yes |
| Emergency Management Accreditation Program | | No | No | Yes |
| Emergency Response Plan | Fayette County Local Emergency Operations Plan (LEOP) | Yes | No | Yes |
| Flood Management Plan | | Yes | No | No |
| Historic Preservation | | Yes | No | No |
| National Flood Insurance Program Participation | | Yes | No | Yes |
| Continuity of Government/ | | No | No | No |

| | | | | |
|--------------------------------|----------------------------|-----|----|----|
| Operations Plan | | | | |
| Post-Disaster Ordinance | | Yes | No | No |
| Zoning Ordinances | County and Municipal Codes | Yes | No | No |

Opportunities to integrate the requirements of this Plan into other local planning mechanisms shall continue to be identified. Although it is recognized that there are many possible benefits to integrating components of this Plan into other local planning mechanisms, the development and maintenance of this stand-alone Hazard Mitigation Plan is deemed by the Fayette County Hazard Mitigation Planning Committee to be the most effective and appropriate method to implement local hazard mitigation actions at this time.

Evaluation

Requirement §201.6(c)(4)(i)

Periodic revisions and updates of the Fayette County Hazard Mitigation Plan may be required to ensure that the goals of this plan are kept current with federal, state, and local regulations. These revisions should also consider any potential changes in the hazard vulnerability and mitigation priorities of Fayette County.

The Fayette County Hazard Mitigation Plan Update Committee will meet annually to review the Fayette County Hazard Mitigation Plan. During this annual review, mitigation strategies will be reviewed to evaluate the progress that has occurred for each identified mitigation strategy. The Fayette County Hazard Mitigation Plan Update Committee will also meet following any disaster event to review the identified mitigation strategies for that hazard and determine if timelines should be adjusted or additional mitigation strategies should be identified and added to the plan. These steps will ensure that the Fayette County Hazard Mitigation Plan is continuously updated to allow for changes in hazard vulnerabilities and identified mitigation strategies.

The Fayette County Hazard Mitigation Plan Update Committee will complete all evaluations of the Fayette County Hazard Mitigation Plan.

Peer Review

State Requirement Element F1

To maintain standards of quality, improve performance, and provide credibility to the Fayette County Hazard Mitigation Plan Update, representatives of local emergency management agencies bordering Fayette County conducted a peer review of the Plan. The peer review of this Plan constitutes a form of self-regulation, accountability, and new insights offered by qualified professionals in neighboring communities, which face many of the same natural and man-made hazards.

Plan Update

Requirement §201.6(c)(4)(i)

The Federal Disaster Mitigation Act of 2000 requires that the Hazard Mitigation Plan be updated at least once every five years. The Fayette County Emergency Management Agency is the department responsible with ensuring this requirement is met. The Fayette County Hazard Mitigation Plan Update Committee will be involved in this future process and will aid the Fayette County Emergency Management Agency in ensuring that all jurisdictions provide input into the planning process. The public will be invited to participate in the planning process through public hearings to be held whenever major updates to this plan are needed and during annual review meetings. This plan will expire in the fourth quarter of 2022; therefore, the approval and adoption of the next plan update must be completed before that time.

In the first quarter of 2023, Fayette County plans to begin the Hazard Mitigation Plan Update process for the fourth time. This planning process will include bi-monthly meetings to accomplish the identified goals of the Fayette County Hazard Mitigation Plan Update. This process will be headed up by the Fayette County Emergency Management Agency. The Fayette County Hazard Mitigation Planning Committee will follow a similar process as was undertaken during this planning cycle to complete all FEMA and GEMA requirements for the Hazard Mitigation Plan Update. This process will be completed by the third quarter of 2024 to meet all identified planning deadlines.

Conclusion

As a result of the hazard mitigation planning process, Fayette County, and all municipalities therein, as well as additional participating organizations have obtained a great deal of information and knowledge regarding Fayette County's disaster history, natural and technological hazards, vulnerabilities, and potential strategies to lessen the impacts of the identified hazards.

One consistent theme identified by the Fayette County Hazard Mitigation Planning Committee was the inability to consistently identify geographic locations that were more vulnerable to most hazards due to the widespread potential effects and random impact areas each hazard could have. This was exceedingly true for most natural hazards. Recognizing this challenge, the Fayette County Hazard Mitigation Plan Update Committee determined it was best to identify many mitigation goals, objectives, and strategies that were both general and specific in nature. These strategies allow the Fayette County Hazard Mitigation Plan Update Committee to adopt strategies that will have the greatest positive effect on the greatest amount of the population.

The Fayette County Hazard Mitigation Planning Committee adopted strategies in all six of the major mitigation categories: Prevention, Property Protection, Natural Resource Protection, Structural Projects, Emergency Services, and Public Education and Awareness. Structural Projects and Emergency Services comprised the greatest number (55.4%) of the mitigation strategies identified by Fayette County.

Appendix A – Fayette County Dams Information*Fayette County Category I Dams*

| Name | Latitude | Longitude | Height (feet) | Storage (acres) |

Appendix E – Fayette County Worksheet 3As

GEMA Worksheet #3a

Inventory of Assets

Jurisdiction: Fayette County

Hazard: Non-Spatially Defined Hazard

Task A. Determine the proportion of buildings, the value of buildings, and the population in your community or state that are located in hazard areas.

| Type of Structure (Occupancy Class) | Number of Structures | | | Value of Structures | | | Number of People | | |
|---|-------------------------------|---------------------|---------------------|-----------------------------|-------------------|---------------------|-------------------------------|---------------------|---------------------|
| | # in Community of State | # in Hazard Area | % in Hazard Area | \$ in Community or State | \$ in Hazard Area | % in Hazard Area | # in Community or State | # in Hazard Area | % in Hazard Area |
| Residential | 38,130 | 38,130 | 100.000% | 9,801,076,055 | 9,801,076,055 | 100.000% | 110,306 | 110,306 | 100% |
| Commercial | 1,269 | 1,269 | 100.000% | 1,327,162,795 | 1,327,162,795 | 100.000% | 0 | 0 | #DIV/0! |

Note: There is not a Consolidated Tax Digest for the Town of Woolsey. Data not available.

Task B. Determine whether (and where) you want to collect additional inventory data.

- | | | |
|---|---|---|
| | Y | N |
| 1. Do you know where the greatest damages may occur in your area? | Y | |
| 2. Do you know whether your critical facilities will be operational after a hazard event? | | N |
| 3. Is there enough data to determine which assets are subject to the greatest potential damages? | Y | |
| 4. Is there enough data to determine whether significant elements of the community are vulnerable to potential hazards? | Y | |
| 5. Is there enough data to determine whether certain areas of historic, environmental, political, or cultural significance are vulnerable to potential hazards? | Y | |
| 6. Is there concern about a particular hazard because of its severity, repetitiveness, or likelihood of occurrence? | Y | |
| 7. Is additional data needed to justify the expenditure of community or state funds for mitigation initiatives? | | N |

GEMA Worksheet #3a **Inventory of Assets**
Jurisdiction: Woolsey (Fayette County)
Hazard: Flood Hazard

Task A. Determine the proportion of buildings, the value of buildings, and the population in your community or state that are located in hazard areas.

| Type of Structure (Occupancy Class) | Number of Structures | | | Value of Structures | | | Number of People | | |
|--|-------------------------|------------------|------------------|--------------------------|-------------------|------------------|-------------------------|------------------|------------------|
| | # in Community of State | # in Hazard Area | % in Hazard Area | \$ in Community or State | \$ in Hazard Area | % in Hazard Area | # in Community or State | # in Hazard Area | % in Hazard Area |

Appendix F – Documentation of Peer Review

Fulton County

Fayette County Hazard Mitigation Plan for Review

Yahoo/Sent

Katy Westbrook <lux.planning@att.net>
To: Matthew Kalmyer

Thu, Aug 6 at 2:52 PM

Good afternoon, Director Kalmyer,

On behalf of Director Mike Singleton, I would like to share with you a copy of the Fayette County Hazard Mitigation Plan update. FEMA requires surrounding jurisdictions be given the opportunity to participate in the planning process. Since Fulton is a contiguous county to Fayette, I am providing you a copy for your review.

You can access the plan here: [Fayette County - FINAL Draft - 8.6.20.docx](#)

If you have any questions, comments, concerns, or recommendations, please feel free to reach out and let us know.

Thank You.

Katy

Good afternoon,

Thanks so much for the opportunity to review the Fayette plan. The plan is very comprehensive and a document that will be very useful for planning going forth. Thanks again and please let us know if there is anything else that we can assist with. Hope you have a great day!!

Glenn
